LARGE SIZE
BALL & ROLLER BEARINGS

CAT. NO. B2002E

Value & Technology

Koyo

Publication of LARGE SIZE BALL & ROLLER BEARINGS

We are pleased to offer you this newly issued Koyo large size rolling bearing catalogue.

The conventional large size rolling bearing catalogue has been thoroughly revised. This catalogue includes information such as the latest bearing types, bearing numbers, and technical data.

We are confident that this catalogue will help every people engaged in design and maintenance of machinery.

This catalogue also shows bearings intended for special purposes. If you have any inquiry for selection of bearings, please contact JTEKT. We are grateful for your patronage and look forward to continuing to serve you in the future.

★ The contents of this catalog are subject to change without prior notice. Every possible effort has been made to ensure that the data herein is correct; however, JTEKT cannot assume responsibility for any errors or omissions.

This publication was made using recycled paper for the protection of forests.

Supplementary table

1. Selection of bearing dimensions

1-1 Bearing service life

When bearings rotate under load, material flakes from the surfaces of inner and outer rings or rolling elements by fatigue arising from repeated contact stress.

This phenomenon is called flaking.

The total number of bearing rotations until flaking occurs is regarded as the bearing "(fatigue) service life".

"(Fatigue) service life" differs greatly depending upon bearing structures, dimensions, materials, and processing methods.

Since this phenomenon results from fatigue distribution in bearing materials themselves, differences in bearing service life should be statistically considered.

When a group of identical bearings are rotated under the same conditions, the total number of revolutions until 90 % of the bearings are left without flaking (i.e. a service life of 90 % reliability) is defined as the basic rating life. In operation at a constant speed, the basic rating life can be expressed in terms of time.

In actual operation, a bearing fails not only because of fatigue, but other factors as well, such as wear, seizure, creep, fretting, brinelling, cracking etc.

These bearing failures can be minimized by selecting the proper mounting method and lubricant, as well as the bearing most suitable for the application.

1-2 Calculation of service life

1-2-1 Basic dynamic load rating

The basic dynamic load rating (C) is either pure radial (for radial bearings) or central axial load (for thrust bearings) of constant magnitude in a constant direction, under which the basic rating life of 1 million revolutions can be obtained, when the inner ring rotates while the outer ring is stationary, or vice versa. The basic dynamic load rating, which represents the capacity of a bearing under rolling fatigue, is specified as **the basic dynamic radial load rating (C_r) for radial bearings, and basic dynamic axial load rating (C_a) for thrust bearings**. These load ratings are listed in the specification table.

These values are prescribed by ISO 281/1990, and are subject to change by conformance to the latest ISO standards.

1-2-2 Basic rating life

The basic rating life in relation to the basic dynamic load rating and dynamic equivalent load can be expressed using equation (1-1).

It is convenient to express the basic rating life in terms of time, using equation (1-2), when a bearing is used for operation at a constant speed.

$$\left(\begin{matrix}\text{Total}\\ \text{revolutions}\end{matrix}\right) \quad L_{10} = \left(\frac{C}{P}\right)^p \quad \cdots\cdots\cdots\cdots (1\text{-}1)$$

$$\text{(Time)} \qquad L_{10h} = \frac{10^6}{60n}\left(\frac{C}{P}\right)^p \quad \cdots\cdots\cdots (1\text{-}2)$$

where :

L_{10}	: basic rating life	10^6 revolutions
L_{10h}	: basic rating life	h
P	: dynamic equivalent load	N
	·····(refer to page 8)	
C	: basic dynamic load rating	N
n	: rotational speed	min^{-1}
p	: for ball bearings ····· $p = 3$	
	for roller bearings ····· $p = 10/3$	

Accordingly, where the dynamic equivalent load is P, and rotational speed is n, equation (1-3) can be used to calculate the basic dynamic load rating C; the bearing size most suitable for a specified purpose can then be selected, referring to the bearing specification table.

$$C = P\left(L_{10h} \times \frac{60n}{10^6}\right)^{1/p} \quad \cdots\cdots\cdots\cdots (1\text{-}3)$$

[Reference]

The equations using a service life coefficient (f_h) and rotational speed coefficient (f_n) respectively, based on equation (1-2), are as follows :

$$L_{10h} = 500\, f_h^{\,p} \quad \cdots\cdots\cdots\cdots (1\text{-}4)$$

Coefficient of service life :

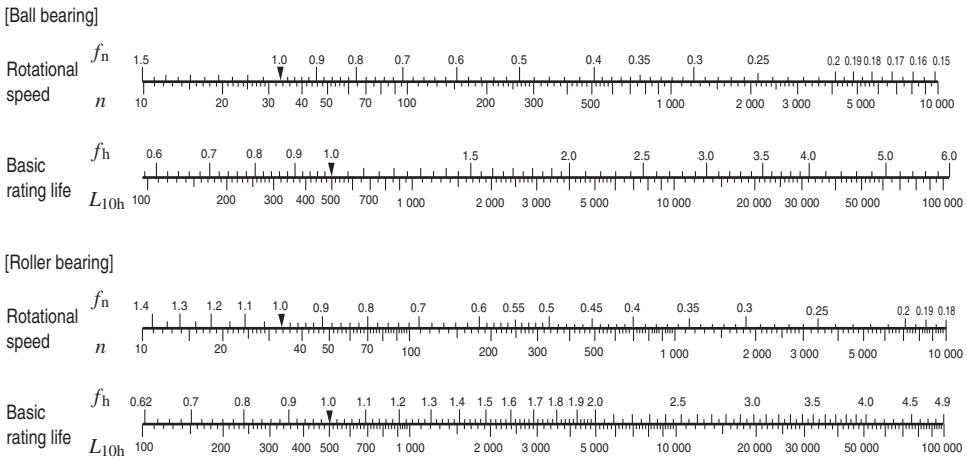
$$f_h = f_n \frac{C}{P} \quad \cdots\cdots\cdots\cdots (1\text{-}5)$$

Coefficient of rotational speed :

$$f_n = \left(\frac{10^6}{500 \times 60n}\right)^{1/p}$$

$$= (0.03n)^{-1/p} \quad \cdots\cdots\cdots\cdots (1\text{-}6)$$

For reference, the values of f_n, f_h, and L_{10h} can be easily obtained by employing the nomograph attached to this catalog, as an abbreviated method.



[Reference] Rotational speed (n) and its coefficients (f_n), and service life coefficient (f_h) and basic rating life (L_{10h})

1-2-3 Correction of basic dynamic load rating for high temperature use and dimension stabilizing treatment

In high temperature operation, bearing material hardness deteriorates, as material compositions are altered. As a result, the basic dynamic load rating is diminished. Once altered, material composition is not recovered, even if operating temperatures return to normal.

Therefore, for bearings used in high temperature operation, the basic dynamic load rating should be corrected by multiplying the basic dynamic load rating values specified in the bearing specification table by the temperature coefficient values in Table 1-1.

Table 1-1 Temperature coefficient values

Bearing temperature, °C	125	150	175	200	250
Temperature coefficient	1	1	0.95	0.90	0.75

Since normal heat treatment is not effective in maintaining the original bearing size in extended operation at 120 °C or higher, dimension stabilizing treatment is necessary. Dimension stabilizing treatment codes and their effective temperature ranges are described in Table 1-2.

Since dimension stabilizing treatment diminishes material hardness, the basic dynamic load rating may be reduced for some types of bearings.

Table 1-2 Dimension stabilizing treatment

Dimension stabilizing treatment code	Effective temperature range
S0	Over 100 °C, up to 150 °C
S1	150 °C 200 °C
S2	200 °C 250 °C

1-2-4 Corrected rating life

The basic rating life (L_{10}), expressed using equation (1-1), is (fatigue) life, whose estimate of reliability is 90 %. A certain application requires a service life whose reliability is more than 90 %.

Special materials help extend bearing life, and lubrication and other operating conditions may also affect bearing service life.

The corrected rating life can be obtained from the basic rating life using equation (1-7).

$$L_{na} = a_1 a_2 a_3 L_{10} \quad \cdots\cdots (1\text{-}7)$$

where :

L_{na} : corrected rating life 10^6 revolutions
(estimated reliability (100–n) % : the probability of failure occurrence is expressed by n, taking bearing characteristics and operating conditions into consideration.)

L_{10} : basic rating life 10^6 revolutions
(estimated reliability 90 %)

a_1 : reliability coefficient
····· refer to section (1)

a_2 : bearing characteristic coefficient
····· refer to section (2)

a_3 : operating condition coefficient
····· refer to section (3)

[Remark]

When bearing dimensions are to be selected given L_{na} greater than 90 % in reliability, the strength of shaft and housing must be considered.

(1) Reliability coefficient a_1

Table 1-3 describes reliability coefficient, a_1, which is necessary to obtain the corrected rating life of reliability greater than 90 %.

Table 1-3 Reliability coefficient a_1

Reliability, %	L_{na}	a_1
90	L_{10a}	1
95	L_{5a}	0.62
96	L_{4a}	0.53
97	L_{3a}	0.44
98	L_{2a}	0.33
99	L_{1a}	0.21

(2) Bearing characteristic coefficient a_2

The bearing characteristic in relation to bearing life may differ according to bearing materials (steel types and their quality), and may be altered by production process, design, etc. In such cases, the bearing life calculation can be corrected using the bearing characteristic coefficient a_2.

JTEKT has employed vacuum-degassed bearing steel as JTEKT standard bearing material. It has a significant effect on bearing life extension which was verified through studies at JTEKT research & development centers.

The basic dynamic load rating of bearings made of vacuum-degassed bearing steel is specified in the bearing specification table, taking the bearing characteristic coefficient as $a_2 = 1$.

For bearings made of special materials to extend fatigue life, the bearing characteristic coefficient is treated as $a_2 > 1$.

(3) Operating condition coefficient a_3

When bearings are used under operating conditions which directly affect their service life, including improper lubrication, the service life calculation can be corrected by using a_3.

Under normal lubrication, the calculation can be performed with $a_3 = 1$; and, under favorable lubrication, with $a_3 > 1$.

In the following cases, the operating condition coefficient is treated as $a_3 < 1$:

- Operation using lubricant of low kinematic viscosity
  (Ball bearing ····· 13 mm^2/s or less
  Roller bearing ····· 20 mm^2/s or less)
- Operation at very slow rotational speed
  (Product of rolling element pitch diameter and rotational speed is 10 000 or less.)
- Contamination of lubricant is expected
- Greater misalignment of inner and outer rings is present

[Note] When bearing hardness is diminished by heat, the basic dynamic load rating calculation must be corrected (ref. Table 1-1).

[Remark]

When $a_2 > 1$ in employing a special material, if lubrication is not proper, $a_2 \times a_3$ is not always > 1. In such cases, if $a_3 < 1$, bearing characteristic coefficient is normally treated as $a_2 \leqq 1$.

As the above explanation shows, since a_2 and a_3 are inter-dependent, some calculations treat them as one coefficient, a_{23} .

1-3 Calculation of loads

Loads affecting bearings includes force exerted by the weight of the object the bearings support, transmission force of devices such as gears and belts, loads generated in equipment during operation etc.

Seldom can these kinds of load be determined by simple calculation, because the load is not always constant.

In many cases, the load fluctuates, and it is difficult to determine the frequency and magnitude of the fluctuation.

Therefore, loads are normally obtained by multiplying theoretical values with various coefficients obtained empirically.

1-3-1 Load coefficient

Even if radial and axial loads are obtained through general dynamic calculation, the actual load becomes greater than the calculated value due to vibration and impact during operation.

In many cases, the load is obtained by multiplying theoretical values by the load coefficient as shown below.

$$F = f_w \cdot F_c \quad \cdots\cdots (1\text{-}8)$$

where :

F : actual load N
F_c : calculated load N
f_w : load coefficient (refer to Table 1-4)

Table 1-4 Load coefficient f_w

Operating condition	Application example	f_w
Operation with little vibration or impact	Motors Machine tools Measuring instrument	1.0 – 1.2
Normal operation (slight impact)	Railway rolling stock Automobiles Paper manufacturing equipment Air blowers Compressors Agricultural equipment	1.2 – 2.0
Operation with severe vibration or impact	Rolling mills Crushers Construction equipment Shaker screens	2.0 – 3.0

1-4 Dynamic equivalent load

Bearings are used under various operating conditions; however, in most cases, bearings receive radial and axial load combined, while the load magnitude fluctuates during operation.

Therefore, it is impossible to directly compare the actual load and basic dynamic load rating.

The two are compared by replacing the loads applied to the shaft center with one of a constant magnitude and in a specific direction, that yields the same bearing service life as under actual load and rotational speed.

This theoretical load is referred to as the dynamic equivalent load (P).

1-4-1 Calculation of dynamic equivalent load

Dynamic equivalent loads for radial bearings and thrust bearings ($\alpha \neq 90°$) which receive a combined load of a constant magnitude in a specific direction can be calculated using the following equation.

$$P = XF_r + YF_a \quad \cdots\cdots (1\text{-}9)$$

where :

- P : dynamic equivalent load N
  (for radial bearings, P_r : dynamic equivalent radial load; for thrust bearings, P_a : dynamic equivalent axial load)
- F_r : radial load N
- F_a : axial load N
- X : radial load factor
- Y : axial load factor
  (values of X and Y are listed in the bearing specification table.)

■ When $F_a/F_r \leqq e$ for single-row radial bearings, it is taken that $X = 1$, and $Y = 0$. Hence, the dynamic equivalent load rating is $P_r = F_r$.

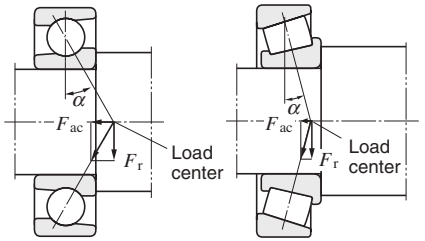
(Values of e, which designates the limit of F_a/F_r, are listed in the bearing specification table.)

■ For single-row angular contact ball bearings and tapered roller bearings, axial component forces (F_{ac}) are generated as shown in Fig. 1-1, therefore a pair of bearings is arranged face-to-face or back-to-back.

The axial component force can be calculated using the following equation.

$$F_{ac} = \frac{F_r}{2Y} \quad \cdots\cdots (1\text{-}10)$$

Table 1-5 describes the calculation of the dynamic equivalent load when radial loads and external axial loads (K_a) are applied to bearings.



(Load center position is listed in the bearing specification table.)

Fig. 1-1 Axial component force

■ For thrust ball bearings with contact angle $\alpha = 90°$, to which an axial load is applied, $P_a = F_a$.

■ The dynamic equivalent load of spherical thrust roller bearing can be calculated using the following equation.

$$P_a = F_a + 1.2F_r \quad \cdots\cdots (1\text{-}11)$$

where : $F_r/F_a \leqq 0.55$

Table 1-5 Dynamic equivalent load calculation : when a pair of single-row angular contact ball bearings or tapered roller bearings is arranged face-to-face or back-to-back.

Paired mounting	Loading condition	Bearing	Axial load	Dynamic equivalent load
Back-to-back arrangement / Face-to-face arrangement				
	$\frac{F_{rB}}{2Y_B} + K_a \geqq \frac{F_{rA}}{2Y_A}$	Bearing A	$\frac{F_{rB}}{2Y_B} + K_a$	$P_A = XF_{rA} + Y_A\left(\frac{F_{rB}}{2Y_B} + K_a\right)$ $P_A = F_{rA}$, where $P_A < F_{rA}$
		Bearing B	–	$P_B = F_{rB}$
	$\frac{F_{rB}}{2Y_B} + K_a < \frac{F_{rA}}{2Y_A}$	Bearing A	–	$P_A = F_{rA}$
		Bearing B	$\frac{F_{rA}}{2Y_A} - K_a$	$P_B = XF_{rB} + Y_B\left(\frac{F_{rA}}{2Y_A} - K_a\right)$ $P_B = F_{rB}$, where $P_B < F_{rB}$
	$\frac{F_{rB}}{2Y_B} \leqq \frac{F_{rA}}{2Y_A} + K_a$	Bearing A	–	$P_A = F_{rA}$
		Bearing B	$\frac{F_{rA}}{2Y_A} + K_a$	$P_B = XF_{rB} + Y_B\left(\frac{F_{rA}}{2Y_A} + K_a\right)$ $P_B = F_{rB}$, where $P_B < F_{rB}$
	$\frac{F_{rB}}{2Y_B} > \frac{F_{rA}}{2Y_A} + K_a$	Bearing A	$\frac{F_{rB}}{2Y_B} - K_a$	$P_A = XF_{rA} + Y_A\left(\frac{F_{rB}}{2Y_B} - K_a\right)$ $P_A = F_{rA}$, where $P_A < F_{rA}$
		Bearing B	–	$P_B = F_{rB}$

[Remarks] 1. These equations can be used when internal clearance and preload during operation are zero.
2. Radial load is treated as positive in the calculation, if it is applied in a direction opposite that shown in Fig. in Table 1-5.

1-4-2 Mean dynamic equivalent load

When load magnitude or direction varies, it is necessary to calculate the mean dynamic equivalent load, which provides the same length of bearing service life as that under the actual load fluctuation.

The mean dynamic equivalent load (P_m) under different load fluctuations is described using Graphs (1) to (4).

(1) Staged fluctuation	(2) Stageless fluctuation
	$P_m = \sqrt[p]{\dfrac{P_1^p n_1 t_1 + P_2^p n_2 t_2 + \cdots + P_n^p n_n t_n}{n_1 t_1 + n_2 t_2 + \cdots\cdots + n_n t_n}}$ ····· (1-12)	$P_m = \dfrac{P_{min} + 2\,P_{max}}{3}$ ····· (1-13)
(3) Fluctuation forming sine curve	**(4) Fluctuation forming sine curve (upper half of sine curve)**
	$P_m = 0.68\,P_{max}$ ····· (1-14)	$P_m = 0.75\,P_{max}$ ····· (1-15)

Symbols for Graphs (1) to (4)

P_m	: mean dynamic equivalent load	N
P_1	: dynamic equivalent load applied for t_1 hours at rotational speed n_1	N
P_2	: dynamic equivalent load applied for t_2 hours at rotational speed n_2	N
⋮	⋮ ⋮	
P_n	: dynamic equivalent load applied for t_n hours at rotational speed n_n	N
P_{min}	: minimum dynamic equivalent load	N
P_{max}	: maximum dynamic equivalent load	N
$\Sigma n_i t_i$	: total rotation in (t_1 to t_i) hours	
p	: for ball bearings ····· $p = 3$ for roller bearings ····· $p = 10/3$	

[Reference] Mean rotational speed n_m can be calculated using the following equation :

$$n_m = \frac{n_1 t_1 + n_2 t_2 + \cdots\cdots + n_n t_n}{t_1 + t_2 + \cdots\cdots + t_n}$$

1-5 Basic static load rating and static equivalent load

1-5-1 Basic static load rating

Excessive static load or impact load even at very low rotation causes partial permanent deformation of the rolling element and raceway contacting surfaces. This permanent deformation increases with the load; if it exceeds a certain limit, smooth rotation will be hindered.

The basic static load rating is the static load which responds to the calculated contact stress shown below, at the contact center between the raceway and rolling elements which receive the maximum load.

- Self-aligning ball bearings ··· 4 600 MPa
- Other ball bearings ····· 4 200 MPa
- Roller bearings ····· 4 000 MPa

The total extent of contact stress-caused permanent deformation on surfaces of rolling elements and raceway will be approximately 0.000 1 times greater than the rolling element diameter.

The basic static load rating for radial bearings is specified as **the basic static radial load rating**, and for thrust bearings, as **the basic static axial load rating**. These load ratings are listed in the bearing specification table, using C_{0r} and C_{0a} respectively.

These values are prescribed by ISO 78/1987 and are subject to change by conformance to the latest ISO standards.

1-5-2 Static equivalent load

The static equivalent load is a theoretical load calculated such that, during rotation at very low speed or when bearings are stationary, the same contact stress as that imposed under actual loading condition is generated at the contact center between raceway and rolling element to which the maximum load is applied.

For radial bearings, radial load passing through the bearing center is used for the calculation; for thrust bearings, axial load in a direction along the bearing axis is used.

The static equivalent load can be calculated using the following equations.

[Radial bearings]

···The greater value obtained by the following two equations is used.

$$P_{0r} = X_0 F_r + Y_0 F_a \quad \cdots\cdots (1\text{-}16)$$

$$P_{0r} = F_r \quad \cdots\cdots (1\text{-}17)$$

[Thrust bearings]

($\alpha \neq 90°$)

$$P_{0a} = X_0 F_r + F_a \quad \cdots\cdots (1\text{-}18)$$

[When $F_a < X_0 F_r$, the solution becomes less accurate.]

($\alpha = 90°$)

$$P_{0a} = F_a \quad \cdots\cdots (1\text{-}19)$$

where :

P_{0r}	: static equivalent radial load	N
P_{0a}	: static equivalent axial load	N
F_r	: radial load	N
F_a	: axial load	N
X_0	: static radial load factor	
Y_0	: static axial load factor	

(values of X_0 and Y_0 are listed in the bearing specification table.)

1-5-3 Safety coefficient

The allowable static equivalent load for a bearing is determined by the basic static load rating of the bearing; however, bearing service life, which is affected by permanent deformation, differs in accordance with the performance required of the bearing and operating conditions.

Therefore, a safety coefficient is designated, based on empirical data, so as to ensure safety in relation to basic static load rating.

$$f_s = \frac{C_0}{P_0} \quad \cdots\cdots (1\text{-}20)$$

where :

f_s : safety coefficient (ref. Table 1-6)
C_0 : basic static load rating N
P_0 : static equivalent load N

Table 1-6 Values of safety coefficient f_s

Operating condition		f_s (min.)	
		Ball bearing	Roller bearing
With bearing rotation	When high running accuracy is required	2	3
	Normal operation	1	1.5
	When impact load is applied	1.5	3
Without bearing rotation (occasional oscillation)	Normal operation	0.5	1
	When impact load or uneven distribution load is applied	1	2

[Remark] For spherical thrust roller bearings, $f_s \geqq 4$.

2. Bearing tolerances

Bearing tolerances and permissible values for the boundary dimensions and running accuracy of bearings are specified. These values are prescribed in JIS, ISO, ABMA, etc.

Bearing tolerances are classified into 6, 5, 4 etc., other than ordinary class 0. Class 0 bearings offer adequate performance for general applications, and bearings of class 5, 4, or higher are required for machine tools.

Table 2-1 shows the tolerance classes and JTEKT codes applied to the types of bearings shown in the dimensional tables.

Bearing tolerances of these bearings are shown in Tables 2-2 through 2-8. Table 2-9 shows the allowable limited values of chamfer dimensions, and Table 2-10 includes the tolerances for tapered bore.

Table 2-1 Tolerance class for each bearing type

Bearing type		Applied standards of tolerance class				Applied tolerance table
Deep groove ball bearing		JIS class 0	JIS class 6	JIS class 5	(JIS class 4)	Table 2-2
Angular contact ball bearing		JIS class 0	JIS class 6	JIS class 5	(JIS class 4)

S_d : Perpendicularity of inner ring face with respect to the bore S_{ia} : Axial runout of assembled bearing inner ring

[Notes] 1) These shall be applied to bearings of diameter series 0, 1, 2, 3 and 4.

2) These shall be applied to deep groove ball bearings and angular contact ball bearings.

3) These shall be appplied to individual bearing rings manufactured for matched pair or stack bearings.

4) Also applicable to the inner ring with tapered bore of $d \geqq 50$ mm.

[Remark] Values in Italics are prescribed in JTEKT standards.

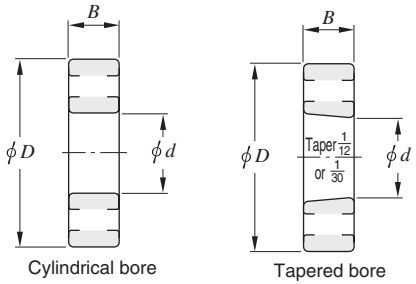
S_D : Perpendicularity of outer ring outside surface with respect to the face
S_{ea} : Axial runout of assembled bearing outer ring
Δ_{Cs} : Deviation of a single outer ring width

[Notes]

1) These shall be applied to bearings of diameter series 0, 1, 2, 3 and 4.
2) Shall be applied when locating snap ring is not fitted.
3) These shall be applied to deep groove ball bearings and angular contact ball bearings.
4) These shall not be applied to flanged bearings.
5) These shall not be applied to shielded bearings and sealed bearings.

[Remark]

Values in Italics are prescribed in JTEKT standards.



Cylindrical bore　　Tapered bore

180	250	+ 72	0	+ 46	0	46
250	315	+ 81	0	+ 52	0	52
315	400	+ 89	0	+ 57	0	57
400	500	+ 97	0	+ 63	0	63
500	630	+110	0	+ 70	0	70
630	800	+125	0	+ 80	0	–
800	1 000	+140	0	+ 90	0	–
1 000	1 250	+165	0	+105	0	–
1 250	1 600	+195	0	+125	0	–

(2) Basically tapered bore (taper 1:30) Unit : μm

Nominal bore diameter d, mm		Δ_{dmp}		$\Delta_{d1mp} - \Delta_{dmp}$		V_{dsp}[1]
over	up to	upper	lower	upper	lower	max.
50	80	+15	0	+30	0	19
80	120	+20	0	+35	0	22
120	180	+25	0	+40	0	40
180	250	+30	0	+46	0	46
250	315	+35	0	+52	0	52
315	400	+40	0	+57	0	57
400	500	+45	0	+63	0	63
500	630	+50	0	+70	0	70

[Note] 1) These shall be applied to all radial planes with tapered bore, not be applied to bearings of diameter series 7, 8.

[Remark] 1) Symbols of quantity d_1 : reference diameter at theoretical large end of tapered bore

$$d_1 = d + \frac{1}{12}B \text{ or } d_1 = d + \frac{1}{30}B$$

Δ_{dmp} : single plane mean bore diameter deviation at theoretical small end of tapered bore

Δ_{d1mp} : single plane mean bore diameter deviation at theoretical large end of tapered bore

V_{dsp} : single plane bore diameter variation (a tolerance for the diameter variation given by a maximum value applying in any radial plane of the bore)

B : nominal inner ring width

α : $\frac{1}{2}$ of nominal tapered angle of tapered bore

(tapered ratio 1/12)	(tapered ratio 1/30)
α = 2°23′9.4″	α = 0°57′17.4″
= 2.385 94°	= 0.954 84°
= 0.041 643 rad	= 0.016 665 rad

3. Bearing fits

3-1 Purpose of fit

The purpose of fit is to securely fix the inner or outer ring to the shaft or housing, to preclude detrimental circumferential sliding on the fitting surface.

Such detrimental sliding (referred to as "creep") will cause abnormal heat generation, wear of the fitting surface, infiltration of abrasion metal particles into the bearing, vibration, and many other harmful effects, which cause a deterioration of bearing functions.

Therefore, it is necessary to fix the bearing ring which is rotating under load to the shaft or housing with interference.

3-2 Tolerance and fit for shaft & housing

For metric series bearings, tolerances for the shaft diameter and housing bore diameter are standardized in JIS B 0401 "limits and fits for engineering" (based on ISO 286 ; shown in Appendixes at the back of this catalog).

Bearing fits on the shaft and housing are determined based on the tolerances specified in the above standard.

Fig. 3-1 shows the relationship between tolerances for shaft and housing bore diameters and fits for bearings of class 0 tolerance.

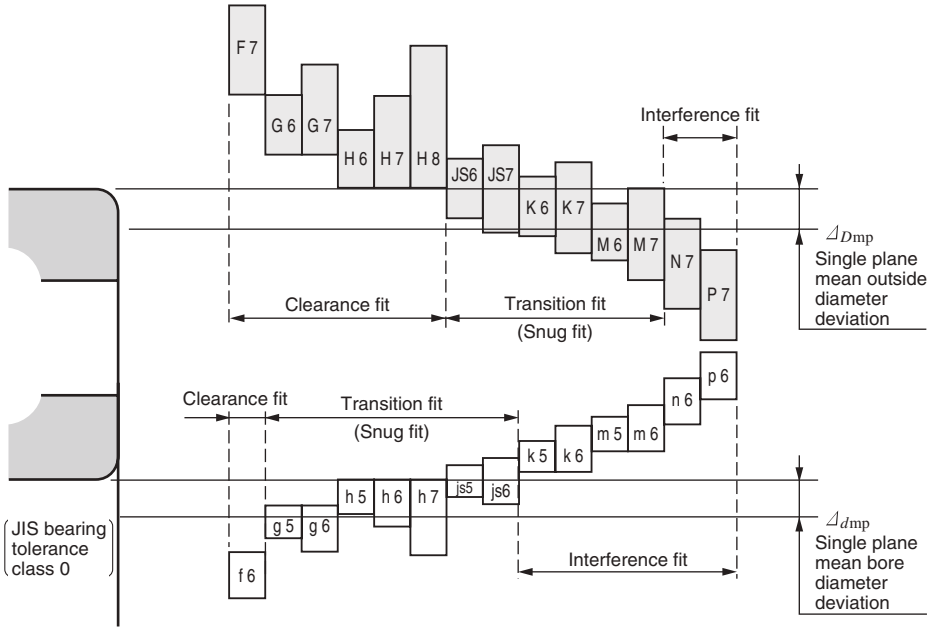

Fig. 3-1 Relationship between tolerances for shaft/housing bore diameters and fits (bearings of class 0 tolerance)

3-3 Fit selection

In selecting the proper fit, careful consideration should be given to bearing operating conditions.

Major specific considerations are :

- Load characteristics and magnitude
- Temperature distribution in operating
- Bearing internal clearance
- Surface finish, material and thickness of shaft and housing
- Mounting and dismounting methods
- Necessity to compensate for shaft thermal expansion at the fitting surface
- Bearing type and size

In view of these considerations, the following paragraphs explain the details of the important factors in fit selection.

1) Load characteristics

Load characteristics are classified into three types : rotating inner ring load; rotating outer ring load and indeterminate direction load.

Table 3-1 tabulates the relationship between these characteristics and fit.

Table 3-1 Load characteristics and fits

Rotation pattern	Direction of load	Loading conditions	Fit		Typical application
			Inner ring & shaft	Outer ring & housing	
 Inner ring : rotating Outer ring : stationary	 Stationary	Rotating inner ring load	Interference fit necessary	Clearance fit acceptable	Spur gear boxes, motors
 Inner ring : stationary Outer ring : rotating	 Rotating (with outer ring)	Stationary outer ring load	(k, m, n, p, r)	(F, G, H, JS)	Greatly unbalanced wheels
 Inner ring : stationary Outer ring : rotating	 Stationary	Stationary inner ring load	Clearance fit acceptable	Interference fit necessary	Running wheels & pulleys with stationary shaft
 Inner ring : rotating Outer ring : stationary	 Rotating (with inner ring)	Rotating outer ring load	(f, g, h, js)	(K, M, N, P)	Shaker screens (unbalanced vibration)
Indeterminate	Rotating or stationary	Indeterminate direction load	Interference fit	Interference fit	Cranks

2) Effect of load magnitude

When a radial load is applied, the inner ring will expand slightly. Since this expansion enlarges the circumference of the bore minutely, the initial interference is reduced.

The reduction can be calculated by the following equations :

[In the case of $F_r \leqq 0.25\ C_0$]

$$\Delta_{dF} = 0.08 \sqrt{\frac{d}{B}} \cdot F_r \times 10^{-3} \quad \cdots\cdots (3\text{-}1)$$

[In the case of $F_r > 0.25\ C_0$]

$$\Delta_{dF} = 0.02 \frac{F_r}{B} \times 10^{-3} \quad \cdots\cdots (3\text{-}2)$$

where :

Δ_{dF} : reduction of inner ring interference mm
d : nominal bore diameter of bearing mm
B : nominal inner ring width mm
F_r : radial load N
C_0 : basic static load rating N

Consequently, when the radial load, exceeds the C_0 value by more than 25 %, greater interference is needed.

Much greater interference is needed, when impact loads are expected.

3) Effect of fitting surface roughness

The effective interference obtained after fitting differs from calculated interference due to plastic deformation of the ring fitting surface. When the inner ring is fitted, the effective interference, subject to the effect of the fitting surface finish, can be approximated by the following equations :

[In the case of a ground shaft]

$$\Delta_{deff} \fallingdotseq \frac{d}{d+2} \Delta_d \quad \cdots\cdots (3\text{-}3)$$

[In the case of a turned shaft]

$$\Delta_{deff} \fallingdotseq \frac{d}{d+3} \Delta_d \quad \cdots\cdots (3\text{-}4)$$

where :

Δ_{deff} : effective interference mm
Δ_d : calculated interference mm
d : nominal bore diameter of bearing mm

4) Effect of temperature

A bearing generally has an operating temperature, higher than the ambient temperature. When the inner ring operates under load, its temperature generally becomes higher than that of the shaft and the effective interference decreases due to the greater thermal expansion of the inner ring.

If the assumed temperature difference between the bearing inside and surrounding housing is Δ_t, the temperature difference at the fitting surfaces of the inner ring and shaft will be approximately (0.10 to 0.15) $\times \Delta_t$.

The reduction of interference (Δ_{dt}) due to temperature difference is then expressed as follows :

$$\Delta_{dt} = (0.10 \text{ to } 0.15)\ \Delta_t \cdot \alpha \cdot d$$
$$\fallingdotseq 0.001\ 5\ \Delta_t \cdot d \times 10^{-3} \quad \cdots\cdots (3\text{-}5)$$

where :

Δ_{dt} : reduction of interference due to temperature difference mm
Δ_t : temperature difference between the inside of the bearing and the surrounding housing °C
α : linear expansion coefficient of bearing steel ($\fallingdotseq 12.5 \times 10^{-6}$) 1/°C
d : nominal bore diameter of bearing mm

Consequently, when a bearing is higher in temperature than the shaft, greater interference is required.

However, a difference in temperature or in the coefficient of expansion may sometimes increase the interference between outer ring and housing. Therefore, when clearance is provided to accommodate shaft thermal expansion, care should be taken.

5) Maximum stress due to fit

When a bearing is fitted with interference, the bearing ring will expand or contract, generating internal stress.

Should this stress be excessive, the bearing ring may fracture.

The maximum bearing fitting-generated stress is determined by the equation in Table 3-2.

In general, to avoid fracture, it is best to adjust the maximum interference to less than 1/1 000 of the shaft diameter, or the maximum stress (σ), determined by the equation in Table 3-2, should be less than 120 MPa.

6) Other considerations

When a high degree of accuracy is required, the tolerance of the shaft and housing must be improved. Since the housing is generally less easy to machine precisely than the shaft, it is advisable to use a clearance fit on the outer ring.

With hollow shafts or thin section housings, greater than normal interference is needed.

With split housings, on the other hand, smaller interference with outer ring is needed.

When the housing is made of aluminum or other light metal alloy, relatively greater than normal interference is needed.

In such a case, consult with JTEKT.

Fits recommended for radial bearings and thrust bearings are shown in Tables 3-3 through 3-6. Fits for rolling mill roll neck bearings are described in section 3-4.

Table 3-2 Maximum fitting-generated stress in bearings

Shaft & inner ring	Housing bore & outer ring
(In the case of hollow shaft) $\sigma = \frac{E}{2} \cdot \frac{\Delta_{deff}}{d} \cdot \frac{\left(1-\frac{d_0^2}{d^2}\right)\left(1+\frac{d^2}{D_i^2}\right)}{\left(1-\frac{d_0^2}{D_i^2}\right)}$ (In the case of solid shaft) $\sigma = \frac{E}{2} \cdot \frac{\Delta_{deff}}{d} \cdot \left(1+\frac{d^2}{D_i^2}\right)$	(In the case of $D_h \neq \infty$) $\sigma = E \cdot \frac{\Delta_{Deff}}{D} \cdot \frac{\left(1-\frac{D^2}{D_h^2}\right)}{\left(1-\frac{D_e^2}{D_h^2}\right)}$ (In the case of $D_h = \infty$) $\sigma = E \cdot \frac{\Delta_{Deff}}{D}$

where :

σ : maximum stress MPa

d : nominal bore diameter (shaft diameter) mm

D_i : raceway contact diameter of inner ring mm
- ball bearing ····· $D_i \fallingdotseq 0.2\ (D + 4\,d)$
- roller bearing ··· $D_i \fallingdotseq 0.25\ (D + 3\,d)$

Δ_{deff} : effective interference of inner ring mm

d_0 : bore diameter of hollow shaft mm

D_e : raceway contact diameter of outer ring mm
- ball bearing ····· $D_e \fallingdotseq 0.2\ (4D + d)$
- roller bearing ··· $D_e \fallingdotseq 0.25\ (3D + d)$

D : nominal outside diameter (bore diameter of housing) mm

Δ_{Deff} : effective interference of outer ring mm

D_h : outside diameter of housing mm

E : young's modulus 2.08×10^5 MPa

[Remark] The above equations are applicable when the shaft and housing are steel. When other materials are used, JTEKT should be consulted.

Table 3-3 (1) Recommended shaft fits for radial bearings (classes 0, 6X, 6)

Conditions [1]		Ball bearing		Cylindrical roller bearing / Tapered roller bearing		Spherical roller bearing		Class of shaft tolerance range	Remarks	Applications (for reference)
		Shaft diameter (mm)

Tapered bore bearing (class 0) (with adapter or withdrawal sleeve)										
All loads		All shaft diameters						h 9 / IT 5 [2]	For transmission shafts, h 10 / IT 7 [2] may be applied.	–

[Notes] 1) Light, normal, and heavy loads refer to those with dynamic equivalent radial loads (P_r) of 6 % or lower, over 6 % up to 12 % inclusive, and over 12 % respectively in relation to the basic dynamic radial load rating (C_r) of the bearing concerned.

2) IT 5 and IT 7 mean that shaft roundness tolerance, cylindricity tolerance, and other errors in terms of shape should be within the tolerance range of IT 5 and IT 7, respectively. For numerical values for standard tolerance grades IT 5 and IT 7, refer to supplementary table at end of this catalog.

[Remark] This table is applicable to solid steel shafts.

Table 3-3 (2) Recommended housing fits for radial bearings (classes 0, 6X, 6)

Conditions				Class of housing bore tolerance range	Remarks	Applications (for reference)
Housing	Load type etc.[1]		Outer ring axial displacement[2]			
One-piece or split type	Stationary outer ring load	All load types	Easily displaceable	H 7	G 7 may be applied when a large size bearing is used, or if the temperature difference is large between the outer ring and housing.	Ordinary bearing devices, railway rolling stock axle boxes, power transmission equipment etc.
		Light or normal load		H 8	–	
		High temperature at shaft and inner ring		G 7	F 7 may be applied when a large size bearing is used, or if the temperature difference is large between the outer ring and housing.	Drying cylinders etc.
One-piece type		Light or normal load, requiring high running accuracy	Not displaceable in principle	K 6	Mainly applied to roller bearings.	
			Displaceable	JS 6	Mainly applied to ball bearings.	
		Requiring low-noise rotation	Easily displaceable	H 6	–	
	Indeterminate direction load	Light or normal load	Normally displaceable	JS 7	For applications requiring high accuracy, JS 6 and K 6 should be used in place of JS 7 and K 7.	Electric motors, pumps, crankshaft main bearings etc.
		Normal or heavy load	Not displaceable in principle	K 7		
		High impact load	Not displaceable	M 7	–	Traction motors etc.
	Rotating outer ring load	Light or fluctuating load	Not displaceable	M 7	–	Conveyor rollers, ropeways, tension pulleys etc.
		Normal or heavy load		N 7	Mainly applied to ball bearings.	Wheel hubs with ball bearings etc.
		Thin section housing, heavy or high impact load		P 7	Mainly applied to roller bearings.	Wheel hubs with roller bearings, bearings for large end of connecting rods etc.

[Notes] 1) Loads are classified as stated in Note 1) to Table 3-3 (1).
2) Indicating distinction between applications of non-separable bearings permitting and not permitting axial displacement of the outer rings.
[Remarks] 1. This table is applicable to cast iron or steel housings.
2. If only central axial load is applied to the bearing, select such tolerance range class as to provide clearance in the radial direction for outer ring.

Table 3-4 Recommended shaft and housing fits for inch series tapered roller bearings (classes 4, 2)

(1) Fits for shaft

Load type		Nominal bore diameter d mm (1/25.4)		Deviation of a single bore diameter Δ_{ds}, μm		Dimensional tolerance of shaft diameter μm		Remarks
		over	up to	upper	lower	upper	lower	
Rotating inner ring load	Normal load	**76.2** (3.0)	**304.8** (12.0)	+25	0	+ 64	+ 38	
		304.8 (12.0)	**609.6** (24.0)	+51	0	+127	+ 76	
		609.6 (24.0)	**914.4** (36.0)	+76	0	+190	+114	
	Heavy load Impact load High speed rotation	**76.2** (3.0)	**304.8** (12.0)	+25	0	Should be such that average interference stands at $0.000\,5 \times d$ (mm)		Generally, bearing internal clearance should be larger than standard.
		304.8 (12.0)	**609.6** (24.0)	+51	0			
		609.6 (24.0)	**914.4** (36.0)	+76	0			
Rotating outer ring load	Normal load without impact	**76.2** (3.0)	**304.8** (12.0)	+25	0	+ 25	0	
		304.8 (12.0)	**609.6** (24.0)	+51	0	+ 51	0	
		609.6 (24.0)	**914.4** (36.0)	+76	0	+ 76	0	
	Normal load without impact	**76.2** (3.0)	**304.8** (12.0)	+25	0	0	– 25	Inner ring is displaceable in axial direction.
		304.8 (12.0)	**609.6** (24.0)	+51	0	0	– 51	
		609.6 (24.0)	**914.4** (36.0)	+76	0	0	– 76	
	Heavy load Impact load High speed rotation	**76.2** (3.0)	**304.8** (12.0)	+25	0	Should be such that average interference stands at $0.000\,5 \times d$ (mm)		Generally, bearing internal clearance should be larger than standard.
		304.8 (12.0)	**609.6** (24.0)	+51	0			
		609.6 (24.0)	**914.4** (36.0)	+76	0			

(2) Fits for housing

Load type		Nominal outside diameter D mm (1/25.4)		Deviation of a single outside diameter Δ_{Ds}, μm		Dimensional tolerance of housing bore diameter μm		Remarks
		over	up to	upper	lower	upper	lower	
Rotating inner ring load	Used for free or fixed side.	**76.2** (3.0)	**127.0** (5.0)	+ 25	0	+ 76	+ 51	Outer ring is easily displaceable in axial direction.
		127.0 (5.0)	**304.8** (12.0)	+ 25	0	+ 76	+ 51	
		304.8 (12.0)	**609.6** (24.0)	+ 51	0	+152	+105	
		609.6 (24.0)	**914.4** (36.0)	+ 76	0	+229	+152	
	Position of outer ring is adjustable (in axial direction).	**76.2** (3.0)	**127.0** (5.0)	+ 25	0	+ 25	0	Outer ring is displaceable in axial direction.
		127.0 (5.0)	**304.8** (12.0)	+ 25	0	+ 51	0	
		304.8 (12.0)	**609.6** (24.0)	+ 51	0	+ 76	+ 25	
		609.6 (24.0)	**914.4** (36.0)	+ 76	0	+127	+ 51	
	Position of outer ring is not adjustable (in axial direction).	**76.2** (3.0)	**127.0** (5.0)	+ 25	0	– 25	– 51	Outer ring is fixed in axial direction.
		127.0 (5.0)	**304.8** (12.0)	+ 25	0	– 25	– 51	
		304.8 (12.0)	**609.6** (24.0)	+ 51	0	– 25	– 76	
		609.6 (24.0)	**914.4** (36.0)	+ 76	0	– 25	–102	
Rotating outer ring load	Position of outer ring is not adjustable (in axial direction).	**76.2** (3.0)	**127.0** (5.0)	+ 25	0	– 25	– 51	Outer ring is fixed in axial direction.
		127.0 (5.0)	**304.8** (12.0)	+ 25	0	– 25	– 51	
		304.8 (12.0)	**609.6** (24.0)	+ 51	0	– 25	– 76	
		609.6 (24.0)	**914.4** (36.0)	+ 76	0	– 25	–102	

Table 3-5 Recommended shaft and housing fits for metric J series tapered roller bearings (classes PK, PN)

(1) Fits for shaft

Load type		Nominal bore diameter d mm over	up to	Class of shaft tolerance range	Remarks
Rotating inner ring load	Normal load	10 120	120 500	m 6 n 6	
	Heavy load Impact load High speed rotation	10 120 180 250	120 180 250 500	n 6 p 6 r 6 r 7	Generally, bearing internal clearance should be larger than standard.
Rotating outer ring load	Normal load without impact	80	315	h 6 or g 6	
	Heavy load Impact load High speed rotation	10 120 180 250	120 180 250 500	n 6 p 6 r 6 r 7	Generally, bearing internal clearance should be larger than standard.

(2) Fits for housing

Load type		Nominal outside diameter D mm over	up to	Class of housing bore diameter tolerance range	Remarks
Rotating inner ring load	Used for free or fixed side	18 315	315 400	G 7 F 6	Outer ring is easily displaceable in axial direction.
	Position of outer ring is adjustable (in axial direction)	18	400	J 7	Outer ring is displaceable in axial direction.
	Position of outer ring is not adjustable (in axial direction)	18	400	P 7	Outer ring is fixed in axial direction.
Rotating outer ring load	Position of outer ring is not adjustable (in axial direction)	18 120 180	120 180 400	R 7	Outer ring is fixed in axial direction.

Table 3-6 Recommended shaft and housing fits for thrust bearings (classes 0, 6)

(1) Fits for shaft

Load type		Shaft diameter, mm over	up to	Class of shaft tolerance range	Remarks
Central axial load (generally for thrust bearings)		All shaft diameters		js 6	h 6 may also be used.
Combined load (spherical thrust roller bearing)	Stationary shaft washer load	All shaft diameters		js 6	–
	Rotating shaft washer load or indeterminate direction load	– 200 400	200 400 –	k 6 m 6 n 6	js 6, k 6 and m 6 may be used in place of k 6, m 6 and n 6, respectively.

(2) Fits for housing

Load type		Class of housing bore diameter tolerance range	Remarks
Central axial load (generally for thrust bearings)		–	Select such tolerance range class as provides clearance in the radial direction for housing washer.
		H 8	In case of thrust ball bearings requiring high accuracy.
Combined load (spherical thrust roller bearing)	Stationary housing washer load	H 7	–
	Indeterminate direction load or rotating housing washer load	K 7	In case of application under normal operating conditions.
		M 7	In case of comparably large radial load.

[Remark] This table is applicable to cast iron or steel housings.

3-4 Recommended fits for rolling mill roll neck bearing

A rolling mill roll neck bearing is subject to inner ring rotating load. Its inner ring always receives a load on its entire circumference, and a load is applied to the outer ring at only one location.

Thus, interference fit is required for the inner ring to prevent any creep, and clearance fit should be used for the outer ring, in principle. For easy attachment, clearance fit has been used for roll neck bearings (because recombination and replacement must be frequently done for roll grinding).

However, with more increase in rolling speed and rolling load, interference fit has been more commonly used to prevent danger of creep to be generated when clearance fit is used and improve in accuracy of products.

Clearance fit is used for the inner rings of deep groove ball bearings and angular ball bearings used as bearings receiving axial load. Between the outer ring and the chock, adequate clearance should be provided in order to prevent any radial load applied to the outer ring.

Tables 3-7 through 3-10 show the recommended fits for roll neck bearings.

When machining a roll neck or chock, its roundness must not exceed 50 % of the allowable tolerances shown in Tables 3-7 through 3-10. If its roundness is poor, fretting corrosion may frequently occur.

Table 3-7 Recommended fits for roll neck metric series four-row tapered roller bearing

						1 400	1 600	0	−160	+345	+220 (E7)

[Note] The table above shows general values. JTEKT determines recommended fit on a case by case basis according to bearing materials and operating conditions to prevent the inner ring from creeping.
Consult with JTEKT when referring to this table.

Table 3-10 Recommended fits of bearing types for support of axial loading

Bearing type	Inner ring and roll neck (shaft)	Outer ring and chock (housing)	
		Mounted to chock	Mounted to sleeve
	Shaft tolerance range class	Chock bore tolerance range class	Sleeve bore tolerance range class
Deep groove ball bearing	e6 or f6	Nominal chock bore (mm) = Outer ring outer dia. + [0.5 to 1.0] H8	G7
Angular ball bearing			
Double row tapered roller bearing (bearings for support of axial loading) ··· TDIS type			
Thrust tapered roller bearing		G7	
Spherical thrust roller bearing			

[Remark] When installing a sleeve, clearance of 0.5 mm or more should be provided between the outer diameter of the sleeve and the bore of the chock.

4. Internal clearance

Bearing internal clearance is defined as the total distance either inner or outer ring can be moved when the other ring is fixed.

If movement is in the radial direction, it is called **radial internal clearance**; if in the axial direction, **axial internal clearance**. (Fig. 4-1)

Bearing performance depends greatly upon internal clearance during operation (also referred to as operating clearance); inappropriate clearance results in short rolling fatigue life and generation of heat, noise or vibration.

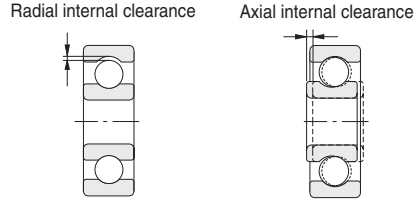

Fig. 4-1 Bearing internal clearance

[Refer.] Relation to radial intearnal clearance and axial internal clearance

(1) Deep groove ball bearing

$$\Delta_a = \sqrt{\Delta_r\,(4m_o - \Delta_r)} \quad \cdots\cdots (4\text{-}1)$$

(2) Double-row angular contact ball bearing

$$\Delta_a = 2\sqrt{m_o^2 - \left(m_o\cos\alpha - \frac{\Delta_r}{2}\right)^2} - 2m_o\sin\alpha \quad \cdots\cdots (4\text{-}2)$$

(3) Matched pair angular contact ball bearing

$$\Delta_a = 2m_o\sin\alpha - 2\sqrt{m_o^2 - \left(m_o\cos\alpha + \frac{\Delta_r}{2}\right)^2} \quad \cdots\cdots (4\text{-}3)$$

(4) Double/four-row and matched pair taperd roller bearing

$$\Delta_a = \Delta_r\cot\alpha \fallingdotseq \frac{1.5}{e}\Delta_r \quad \cdots\cdots (4\text{-}4)$$

where :

Δ_a : Axial internal clearance mm
Δ_r : Radial internal clearance mm
α : Nominal contact angle deg.
e : Limited value of F_a/F_r (shown in the bearing specification table)
m_o : $r_e + r_i - D_w$ mm
(r_e : Outer ring raceway groove radius mm
r_i : Inner ring raceway groove radius mm
D_w : Ball diameter mm)

The term **residual clearance** is defined as the original clearance decreased owing to expansion or contraction of a raceway due to fitting, when the bearing is mounted in the shaft and housing.

The term **effective clearance** is defined as the residual clearance decreased owing to dimensional change arising from temperature differentials within the bearing.

The term **operating clearance** is defined as the internal clearance present while a bearing mounted in a machine is rotating under a certain load, or, the effective clearance increased due to elastic deformation arising from bearing loads.

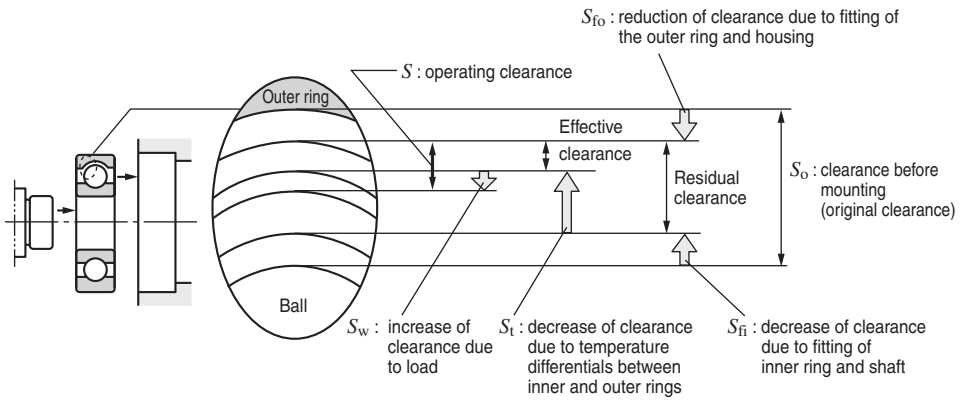
Operating clearance gives great influences on the performance and service life of bearings. Thus, it is recommended to select the operating clearance of a ball bearing so that the operating clearance is slightly positive, while the lower limited value of the operating clearance range of a roller bearing is slightly positive.

It is important to take specific operating conditions into consideration and select a clearance suitable for the conditions.

For example, when high rigidity is required, or when the noise must be minimized, the operating clearance must be reduced. On the other hand, when high operating temperature is expected, the operating clearance must be increased.

Table 4-1 shows how to determine the operating clearance in the case of shaft and housing made of steel. The standard values of bearing internal clearance before mounting are shown in Tables 4-2 through 4-6.

Table 4-1 How to determine operating clearance



Operating clearance (S)	$S = S_o - (S_f + S_{t1} + S_{t2}) + S_w$ *	* S_w (increase of clearance due to load) is generally small, and thus may be ignored, although there is a equation for determining the value.
Decrease of clearance due to fitting (S_f)	(In the case of hollow shaft) $S_{fi} = \Delta_{deff} \frac{d}{D_i} \cdot \frac{\left(1 - \frac{d_0^2}{d^2}\right)}{\left(1 - \frac{d_0^2}{D_i^2}\right)}$ (In the case of solid shaft) $S_{fi} = \Delta_{deff} \frac{d}{D_i}$	(In the case of $D_h \neq \infty$) $S_{fo} = \Delta_{Deff} \frac{D_e}{D} \cdot \frac{\left(1 - \frac{D^2}{D_h^2}\right)}{\left(1 - \frac{D_e^2}{D_h^2}\right)}$ (In the case of $D_h = \infty$) $S_{fo} = \Delta_{Deff} \frac{D_e}{D}$
Decrease of clearance due to temperature differentials between inner and outer rings (S_{t1})	The amount of decrease varies depending on the state of housing; however, generally the amount can be approximated by the following equation on the assumption that the outer ring will not expand : $S_{t1} = \alpha (D_i \cdot t_i - D_e \cdot t_e)$	where : $D_e = D_i + 2D_w$ Consequently, $S_{t1} + S_{t2}$ will be determined by the following equation : $S_{t1} + S_{t2} = \alpha \cdot D_i \cdot t_1 + 2\alpha \cdot D_w \cdot t_2$ Temperature differential between the inner and outer rings, t_1, can be expressed as follows : $t_1 = t_i - t_e$ Temperature differential between the rolling element and outer ring, t_2, can be expressed as follows : $t_2 = t_w - t_e$
Decrease of clearance due to temperature rise of rolling element (S_{t2})	$S_{t2} = 2\alpha \cdot D_w \cdot t_w$	

In Table 4-1,

S : operating clearance mm
S_o : clearance before mounting mm
S_f : decrease of clearance due to fitting mm
S_{fi} : expansion of inner ring raceway contact diameter mm
S_{fo} : contraction of outer ring raceway contact diameter mm
S_{t1} : decrease of clearance due to temperature differentials between inner and outer rings mm
S_{t2} : decrease of clearance due to temperature rise of the rolling elements mm
S_w : increase of clearance due to load mm
Δ_{deff} : effective interference of inner ring mm
d : nominal bore diameter (shaft diameter) mm
d_0 : bore diameter of hollow shaft mm
D_i : inner ring raceway contact diameter mm
(ball bearing ····· $D_i \fallingdotseq 0.2 \quad (D + 4\,d)$ / roller bearing ··· $D_i \fallingdotseq 0.25\,(D + 3\,d)$)

Δ_{Deff} : effective interference of outer ring mm
D_h : outside diameter of housing mm
D_e : outer ring raceway contact diameter mm
(ball bearing ····· $D_e \fallingdotseq 0.2 \quad (4D + d)$ / roller bearing ··· $D_e \fallingdotseq 0.25\,(3D + d)$)
D : nominal outside diameter mm
α : linear expansion coefficient of bearing steel (12.5×10^{-6}) 1/°C
D_w : average diameter of rolling elements mm
(ball bearing ····· $D_w \fallingdotseq 0.3 \quad (D - d)$ / roller bearing ··· $D_w \fallingdotseq 0.25\,(D - d)$)
t_i : temperature rise of the inner ring °C
t_e : temperature rise of the outer ring °C
t_w : temperature rise of rolling elements °C

■Bearings are sometimes used with a non-steel shaft or housing.
In the automotive industry, a statistical method is often incorporated for selection of clearance.
In these cases, or when other special operating conditions are involved, JTEKT should be consulted.

5. Lubrication

Lubrication is one of the most important factors determining bearing performance. The suitability of the lubricant and lubrication method have a dominant influence on bearing life.

Functions of lubrication :

- To lubricate each part of the bearing, and to reduce friction and wear
- To carry away heat generated inside bearing due to friction and other causes
- To cover rolling contact surface with the proper oil film in order to prolong bearing fatigue life
- To prevent corrosion and contamination by dirt

Bearing lubrication is classified broadly into two categories: grease lubrication and oil lubrication. Table 5-1 makes a general comparison between the two.

Table 5-1 Comparison between grease and oil lubrication

Item	Grease	Oil
· Sealing device	Easy	Slightly complicated and special care required for maintenance
· Lubricating ability	Good	Excellent
· Rotation speed	Low/medium speed	Applicable at high speed as well
· Replacement of lubricant	Slightly troublesome	Easy
· Life of lubricant	Relatively short	Long
· Cooling effect	No cooling effect	Good (circulation is necessary)
· Filtration of dirt	Difficult	Easy

5-1 Grease lubrication

Grease lubrication is widely applied since there is no need for replenishment over a long period once grease is filled, and a relatively simple structure can suffice for the lubricant sealing device.

There are two methods of grease lubrication. One is the closed lubrication method, in which grease is filled in advance into shielded/sealed bearing; the other is the feeding method, in which the bearing and housing are filled with grease in proper quantities at first, and refilled at a regular interval via replenishment or replacement.

Devices with numerous grease inlets sometimes employ the centralized lubricating method, in which the inlets are connected via piping and supplied with grease collectively.

1) Amount of grease

In general, grease should fill approximately one-third to one-half the inside space, though this varies according to structure and inside space of housing.

It must be borne in mind that excessive grease will generate heat when churned, and will consequently alter, deteriorate, or soften.

When the bearing is operated at low speed, however, the inside space is sometimes filled with grease to two-thirds to full, in order to preclude infiltration of contaminants.

2) Replenishment/replacement of grease

The method of replenishing/replacing grease depends largely on the lubrication method. Whichever method may be utilized, care should be taken to use clean grease and to keep dirt or other foreign matter out of the housing.

In addition, it is desirable to refill with grease of the same brand as that filled at the start.

When grease is refilled, new grease must be injected inside bearing.

Fig. 5-1 gives one example of a feeding method.

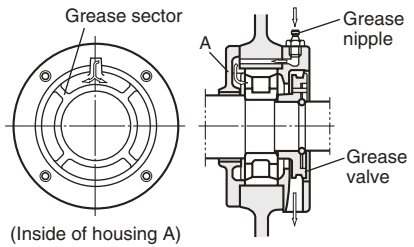

Fig. 5-1 Example of grease feeding method (using grease sector)

In the example, the inside of the housing is divided by grease sectors. Grease fills one sector, then flows into the bearing.

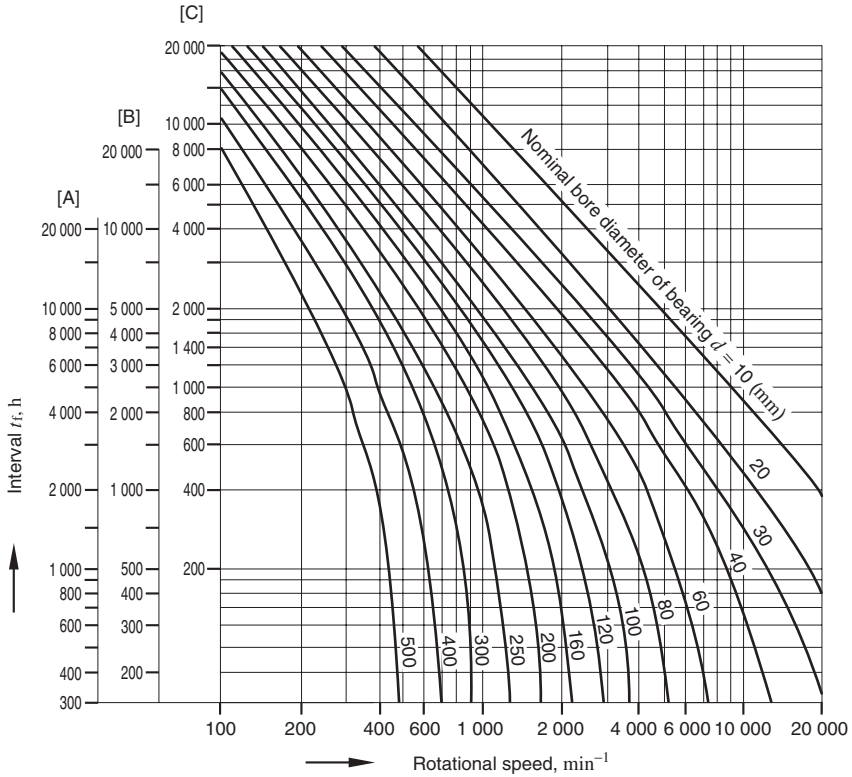
On the other hand, grease flowing back from the inside is forced out of the bearing by the centrifugal force of the grease valve.

When the grease valve is not used, it is necessary to enlarge the housing space on the discharge side to store old grease.

The housing is uncovered and the stored old grease is removed at regular intervals.

3) Grease feeding interval

In normal operation, grease life should be regarded roughly as shown in Fig. 5-2, and replenishment/replacement should be carried out accordingly.



[Notes] 1) [A] : radial ball bearing

[B] : cylindrical roller bearing, needle roller bearing

[C] : tapered roller bearing, spherical roller bearing, thrust ball bearing

2) Temperature correction

When the bearing operating temperature exceeds 70 °C, t_f', obtained by multiplying t_f by correction coefficient a, found on the scale below, should be applied as the feeding interval.

$$t_f' = t_f \times a$$

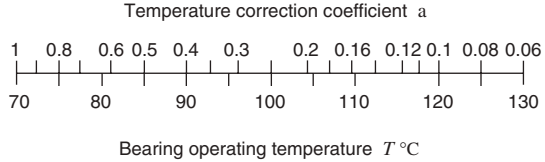


Fig. 5-2 Grease feeding interval

5-2 Oil lubrication

Oil lubrication is usable even at high speed rotation and somewhat high temperature, and is effective in reducing bearing vibration and noise.

Thus oil lubrication is used in many cases where grease lubrication does not work.

Table 5-2 shows major types and methods of oil lubrication.

Table 5-2 Type and method of oil lubrication

(1) Oil bath	• Simplest method of bearing immersion in oil for operation. • Suitable for low/medium speed. • Oil level gauge should be furnished to adjust the amount of oil. (In the case of horizontal shaft) About 50 % of the lowest rolling element should be immersed. (In the case of vertical shaft) About 70 to 80 % of the bearing should be immersed. • It is better to use a magnetic plug to prevent wear iron particles from dispersing in oil.	(2) Oil drip	• Oil is dripped with an oiling device, and the inside of the housing is filled with oil mist by the action of rotating parts. This method has a cooling effect. • Applicable at relatively high speed and up to medium load. • In general, 5 to 6 drops of oil are utilized per minute. (It is difficult to adjust the dripping in 1 mL/h or smaller amounts.) • It is necessary to prevent too much oil from being accumulated at the bottom of housing.	(3) Oil splash	• This type of lubrication method makes use of a gear or simple flinger attached to shaft in order to splash oil. This method can supply oil for bearings located away from the oil tank. • Usable up to relatively high speed. • It is necessary to keep oil level within a certain range. • It is better to use a magnetic plug to prevent wear iron particles from dispersing in oil. It is also advisable to set up a shield or baffle board to prevent contaminants from entering the bearing.	
(4) Forced oil circulation	• This method employs a circulation-type oil supply system. Supplied oil lubricates inside of the bearing, is cooled and sent back to the tank through an oil escape pipe. The oil, after filtering and cooling, is pumped back. • Widely used at high speeds and high temperature conditions. • It is better to use an oil escape pipe approximately twice as thick as the oil supply pipe in order to prevent too much lubricant from gathering in housing. • Required amount of oil : see Remark 1 (on page 56).	(5) Oil jet lubrication	• This method uses a nozzle to jet oil at a constant pressure (0.1 to 0.5 MPa), and is highly effective in cooling. • Suitable for high speed and heavy load. • Generally, the nozzle (diameter 0.5 to 2 mm) is located 5 to 10 mm from the side of a bearing. When a large amount of heat is generated, 2 to 4 nozzles should be used. • Since a large amount of oil is supplied in the jet lubrication method, old should be discharged with an oil pump to prevent excessive residual oil. • Required amount of oil : see Remark 1 (on page 56).	(6) Oil mist lubrication (spray lubrication)	• This method employs an oil mist generator to produce dry mist (air containing oil in the form of mist). The dry mist is continuously sent to the oil supplier, where the mist is turned into a wet mist (sticky oil drops) by a nozzle set up on the housing or bearing, and is then sprayed onto bearing. • Required amount of mist : see Remark 2 (on page 57). • This method provides and sustains the smallest amount of oil film necessary for lubrication, and has the advantages of preventing oil contamination, simplifying bearing maintenance, prolonging bearing fatigue life, reducing oil consumption etc.	(Example of grinding machine)  (Example of rolling mill) 
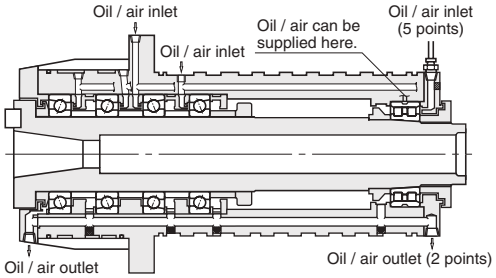
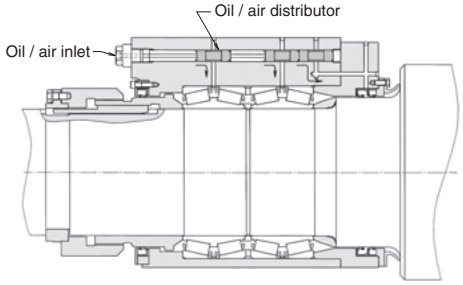
(7) Oil / air lubrication

- A proportioning pump sends forth a small quantity of oil, which is mixed with compressed air by a mixing valve. The admixture is supplied continuously and stably to the bearing.
- This method enables quantitative control of oil in extremely small amounts, always supplying new lubricating oil. It is thus suitable for machine tools and other applications requiring high speed.
- Compressed air and lubricating oil are supplied to the spindle, increasing the internal pressure and helping prevent dirt, cutting-liquid, etc. from entering. As well, this method allows the lubricating oil to flow through a feeding pipe, minimizing atmospheric pollution.



(Example of spindle unit incorporating oil / air lubrication system)



(Example of rolling mill roll neck bearing)

Remark 1 **Required oil supply in forced oil circulation ; oil jet lubrication methods**

$$G = \frac{1.88 \times 10^{-4}\,\mu \cdot d \cdot n \cdot P}{60\ c \cdot r \cdot \Delta_T}$$

where :

G	: required oil supply	L/min
μ	: friction coefficient (see table at right)	
d	: nominal bore diameter	mm
n	: rotational speed	min^{-1}
P	: dynamic equivalent load of bearing	N
c	: specific heat of oil	1.88–2.09kJ/kg·K
r	: density of oil	g/cm^3
Δ_T	: temperature rise of oil	K

Values of friction coefficient μ

Bearing type	μ
Deep groove ball bearing	0.001 0 – 0.001 5
Angular contact ball bearing	0.001 2 – 0.002 0
Cylindrical roller bearing	0.000 8 – 0.001 2
Tapered roller bearing	0.001 7 – 0.002 5
Spherical roller bearing	0.002 0 – 0.002 5

The values obtained by the above equation show quantities of oil required to carry away all the generated heat, with heat release not taken into consideration.

In reality, the oil supplied is generally half to two-thirds of the calculated value.

Heat release varies widely according to the application and operating conditions.

To determine the optimum oil supply, it is advised to start operating with two-thirds of the calculated value, and then reduce the oil gradually while measuring the operating temperature of bearing, as well as the supplied and discharged oil.

Remark 2 **Notes on oil mist lubrication**

1) Required amount of mist
(mist pressure : 5 kPa)

(In the case of a bearing) $Q = \frac{0.11dR}{1\,000}$

(In the case of two oil seals combined) $Q = \frac{0.028d_1}{1\,000}$

where :

Q	: required amount of mist	L/min
d	: nominal bore diameter	mm
R	: number of rolling element rows	
d_1	: inside diameter of oil seal	mm

In the case of high speed ($d_m n \geqq 400 \times 10^3$), it is necessary to increase the amount of oil and heighten the mist pressure.

2) Piping diameter and design of lubrication hole/groove

When the flow rate of mist in piping exceeds 5 m/s, oil mist suddenly condenses into an oil liquid.

Consequently, the piping diameter and dimensions of the lubrication hole/groove in the housing should be designed to keep the flow rate of mist, obtained by the following equation, from exceeding 5 m/s.

$$V = \frac{0.167Q}{A} \leqq 5$$

where :

V	: flow rate of mist	m/s
Q	: amount of mist	L/min
A	: sectional area of piping or lubrication groove	cm^2

3) Mist oil

Oil used in oil mist lubrication should meet the following requirements.

- ability to turn into mist
- has high extreme pressure resistance
- good heat/oxidation stability
- rust-resistant
- unlikely to generate sludge
- superior demulsifier

Oil mist lubrication has a number of advantages for high speed rotation bearings. Its performance, however, is largely affected by surrounding structures and bearing operating conditions.

If contemplating the use of this method, please contact with JTEKT for advice based on JTEKT long experience with oil mist lubrication.

Remark 3 **Required oil supply in oil / air lubrication (Rolling mill roll neck bearing)**

Horizontal roll $Q = \frac{0.085dR}{A}$

Vertical roll $Q = \frac{0.170dR}{A}$

where :

Q	: Required oil supply	cm^3/h
d	: Nominal bore diameter	mm
R	: Number of rolling element rows	
A	: Coefficient (low speed : 10, high speed : 5)	

5-3 Lubricant

5-3-1 Grease

Grease is made by mixing and dispersing a solid of high oil-affinity (called a thickener) with lubricant oil (as a base), and transforming it into a semi-solid state.

As well, a variety of additives can be added to improve specific performance.

(1) Base oil

Mineral oil is usually used as the base oil for grease. When low temperature fluidity, high temperature stability, or other special performance is required, diester oil, silicon oil, polyglycolic oil, fluorinated oil, or other synthetic oil is often used.

Generally, grease with a low viscosity base oil is suitable for applications at low temperature or high rotation speed; grease with high viscosity base oils are suitable for applications at high temperature or under heavy load.

(2) Thickener

Most greases use a metallic soap base such as lithium, sodium, or calcium as thickeners. For some applications, however, non-soap base thickeners (inorganic substances such as bentone, silica gel, and organic substances such as urea compounds, fluorine compounds) are also used.

In general, the mechanical stability, bearing operating temperature range, water resistance, and other characteristics of grease are determined by the thickener.

(Lithium soap base grease)
Superior in heat resistance, water resistance and mechanical stability.

(Calcium soap base grease)
Superior in water resistance; inferior in heat resistance.

(Sodium soap base grease)
Superior in heat resistance; inferior in water resistance.

(Non-soap base grease)
Superior in heat resistance.

(3) Additives

Various additives are selectively used to serve the respective purposes of grease applications.

- Extreme pressure agents
  When bearings must tolerate heavy or impact loads.
- Oxidation inhibitors
  When grease is not refilled for a long period.
  Structure stabilizers, rust preventives, and corrosion inhibitors are also used.

(4) Consistency

Consistency, which indicates grease hardness, is expressed as a figure obtained, in accordance with ASTM (JIS), by multiplication by 10 the depth (in mm) to which the cone-shaped metallic plunger penetrates into the grease at 25 °C by deadweight in 5 seconds. The softer the grease, the higher the figure.

Table 5-4 shows the relationships between the NLGI scales and ASTM (JIS) penetration indexes, service conditions of grease.

(NLGI : National Lubricating Grease Institute)

Table 5-4 Grease consistency

NLGI scale	ASTM (JIS) penetration index (25 °C, 60 mixing operations)	Service conditions/ applications
0	355 – 385	For centralized lubricating
1	310 – 340	For centralized lubricating, at low temperature
2	265 – 295	For general use
3	220 – 250	For general use, at high temperature
4	175 – 205	For special applications

(5) Mixing of different greases

Since mixing of different greases changes their properties, greases of different brands should not be mixed.

If mixing cannot be avoided, greases containing the same thickener should be used. Even if the mixed greases contain the same thickener, however, mixing may still produce adverse effects, due to difference in additives or other factors.

Thus it is necessary to check the effects of a mixture in advance, through testing or other methods.

Table 5-3 Characteristics of respective greases

	Lithium grease			Calcium grease (cup grease)	Sodium grease (fiber grease)	Complex base grease		Non-soap base grease			
Thickener	Lithium soap			Calcium soap	Sodium soap	Lithium complex soap	Calcium complex soap	Bentone	Urea compounds	Fluorine compounds	Thickener
Base oil	Mineral oil	Synthetic oil (diester oil)	Synthetic oil (silicon oil)	Mineral oil	Mineral oil	Mineral oil	Mineral oil	Mineral oil	Mineral/ synthetic oil	Synthetic oil	Base oil

Remarks	Most widely usable for various rolling bearings.	Superior low temperature and friction characteristics. Suitable for bearings for measuring instruments and extra-small ball bearings for small electric motors.	Superior high and low temperature characteristics.	Suitable for applications at low rotation speed and under light load. Not applicable at high temperature.	Liable to emulsify in the presence of water. Used at relatively high temperature.	Superior mechanical stability and heat resistance. Used at relatively high temperature.	Superior pressure resistance when extreme pressure agent is added. Used in bearings for rolling mills.	Suitable for applications at high temperature and under relatively heavy load.	Superior water resistance, oxidation stability, and heat stability. Suitable for applications at high temperature and high speed.	Superior chemical resistance and solvent resistance. Usable at up to 250 °C.	Remarks

5-3-2 Lubricating oil

For lubrication, bearings usually employ highly refined mineral oils, which have superior oxidation stability, rust-preventive effect, and high film strength.

With bearing diversification, however, various synthetic oils have been put into use.

These synthetic oils contain various additives (oxidation inhibitors, rust preventives, antifoaming agents, etc.) to improve specific properties. Table 5-5 shows the characteristics of lubricating oils.

Mineral lubricating oils are classified by applications in JIS and MIL.

Table 5-5 Characteristics of lubricating oils

Type of lubricating oil	Highly refined mineral oil	Major synthetic oils				
		Diester oil	Silicon oil	Polyglycolic oil	Polyphenyl ether oil	Fluorinated oil
Operating temperature range (℃)	− 40 to + 220	− 55 to + 150	− 70 to + 350	− 30 to + 150	0 to + 330	− 20 to + 300

Radioactivity resistance	Bad	Bad	Bad to fair	Bad	Excellent	–

[Selection of lubricating oil]

The most important criterion in selecting a lubricating oil is whether the oil provides proper viscosity at the bearing operating temperature.

Standard values of proper kinematic viscosity can be obtained through selection by bearing type according to Table 5-6 first, then through selection by bearing operating conditions according to Table 5-7.

When lubricating oil viscosity is too low, the oil film will be insufficient. On the other hand, when the viscosity is too high, heat will be generated due to viscous resistance.

In general, the heavier the load and the higher the operating temperature, the higher the lubricating oil viscosity should be ; whereas, the higher the rotation speed, the lower the viscosity should be.

Fig. 5-3 illustrates the relationship between lubricating oil viscosity and temperature.

Table 5-6 Proper kinematic viscosity by bearing type

Bearing type	Proper kinematic viscosity at operating temperature
Ball bearing Cylindrical roller bearing	13 mm^2/s or higher
Tapered roller bearing Spherical roller bearing	20 mm^2/s or higher
Spherical thrust roller bearing	32 mm^2/s or higher

Table 5-7 Proper kinematic viscosities by bearing operating conditions

Operating temperature	$d_m n$ value	Proper kinematic viscosity (expressed in the ISO viscosity grade or the SAE No.)			
		Light/normal load		Heavy/impact load	
−30 ~ 0 ℃	All rotation speeds	ISO VG 15, 22, 46	(Refrigerating machine oil)	–	
0 ~ 60 ℃	300 000 or lower	ISO VG 46	(Bearing oil Turbine oil)	ISO VG 68 SAE 30	(Bearing oil Turbine oil)
	300 000 to 600 000	ISO VG 32	(Bearing oil Turbine oil)	ISO VG 68	(Bearing oil Turbine oil)
	600 000 or higher	ISO VG 7, 10, 22	(Bearing oil)	–	
60 ~ 100 ℃	300 000 or lower	ISO VG 68	(Bearing oil)	ISO VG 68, 100 SAE 30	(Bearing oil)
	300 000 to 600 000	ISO VG 32, 46	(Bearing oil Turbine oil)	ISO VG 68	(Bearing oil Turbine oil)
	600 000 or higher	ISO VG 22, 32, 46	(Bearing oil Turbine oil Machine oil)	–	
100 ~ 150 ℃	300 000 or lower	ISO VG 68, 100 SAE 30, 40	(Bearing oil)	ISO VG 100 ~ 460	(Bearing oil Gear oil)
	300 000 to 600 000	ISO VG 68 SAE 30	(Bearing oil Turbine oil)	ISO VG 68, 100 SAE 30, 40	(Bearing oil)

[Remarks] 1. $d_m n = \frac{D+d}{2} \times n$ ·····{D : nominal outside diameter (mm), d : nominal bore diameter (mm), n : rotational speed (min^{-1})}

2. Refer to refrigerating machine oil (JIS K 2211), turbine oil (JIS K 2213), gear oil (JIS K 2219), machine oil (JIS K 2238) and bearing oil (JIS K 2239).

3. Please contact with JTEKT if the bearing operating temperature is under −30 ℃ or over 150 ℃ .

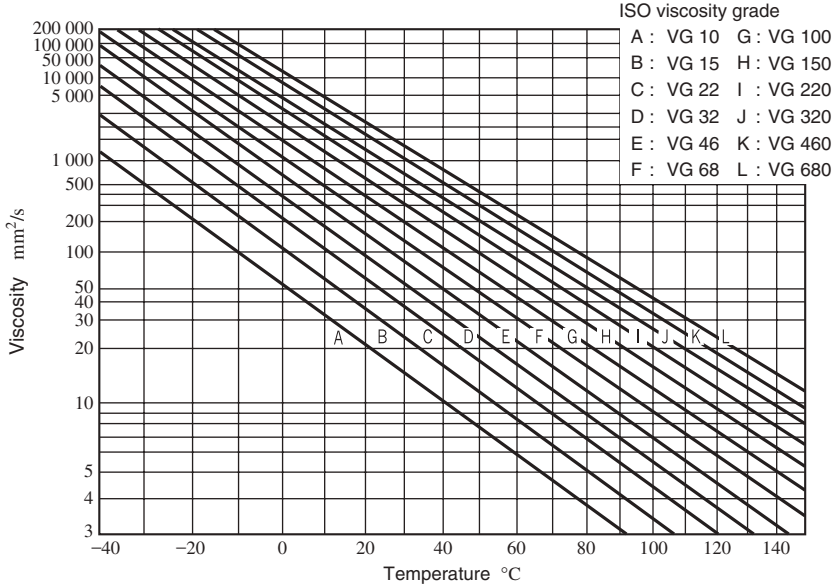

Fig. 5-3 Relationship between lubricating oil viscosity and temperature (viscosity index : 100)

6. Bearing materials

Bearing materials include steel for bearing rings and rolling elements, as well as steel sheet, steel, copper alloy and synthetic resins for cages.

These bearing materials should possess the following characteristics :

1) High elasticity, durable under high partial contact stress. — Bearing rings
2) High strength against rolling contact fatigue due to large repetitive contact load. — Rolling elements
3) Strong hardness — Rolling elements
4) High abrasion resistance — Bearing rings
5) High toughness against impact load — Bearing rings, Rolling elements
6) Excellent dimensional stability — Cages

6-1 Bearing rings and rolling elements materials

1) High carbon chromium bearing steel

High carbon chromium bearing steel specified in JIS is used as a general material in bearing rings (inner rings, outer rings) and rolling elements (balls, rollers).

Their chemical composition classified by steel type is given in Table 6-1.

Among these steel types, SUJ 2 is generally used. SUJ 3, which contains additional Mn and Si, possesses high hardenability and is commonly used for thick section bearings.

SUJ 5 has increased hardenability, because it was developed by adding Mo to SUJ 3.

For small and medium size bearings, SUJ 2 and SUJ 3 are used, and for large size and extra-large size bearings with thick sections, SUJ 5 is widely used.

Generally, these materials are processed into the specified shape and then undergo hardening and annealing treatment until they attain a hardness of 57 to 64 HRC.

2) Case carburizing bearing steel (case hardened steel)

When a bearing receives heavy impact loads, the surface of the bearing should be hard and the inside soft.

Such materials should possess a proper amount of carbon, dense structure, and carburizing case depth on their surface, while having proper hardness and fine structure internally.

For this purpose, chromium steel and nickel-chromium-molybdenum steel are used as materials.

Typical steel materials are shown in Table 6-2.

These materials also undergo vacuum degassing in order to reduce non-metallic inclusions and oxygen content which leads to higher reliability.

3) Others

For special applications, the following materials are used, according to operational conditions.

(When very high reliability is required)
- · high refining steel ··· developed by JTEKT
- · vacuum arc remelted steel
- · electro slag remelted steel

(When heat resistance is required)
- · high speed steel for high temperature bearings ··· refer to Table 6-3

(When high corrosion resistance is required)
- · stainless steel ··· refer to Table 6-4

(When high heat, corrosion, and chemical resistance are required)
- · ceramics

Table 6-1 Chemical composition of high carbon chromium bearing steel

Standard	Code	Chemical composition (%)

6-2 Materials used for cages

Since the characteristics of materials used for cages greatly influence the performance and reliability of rolling bearings, the choice of materials is of great importance.

It is necessary to select cage materials in accordance with required shape, ease of lubrication, strength, and abrasion resistance.

Typical materials used for metallic cages are shown in Tables 6-5 and 6-6.

In addition, phenolic resin machined cages and other synthetic resin molded cages are often used.

Materials typically used for molded cages are polyacetal, polyamide (Nylon 6.6, Nylon 4.6), and polymer containing fluorine, which are strengthened with glass and carbon fibers.

7. Examples of failures

Table 7-1 (1) Bearing failures, causes and countermeasures

Failures	Characteristics	Damages		Causes	Countermeasures
(1) Flaking	 Flaking caused by excessive axial load Inner ring of four-row tapered roller bearing	Flaking on bearing raceway surface generated on only rows receiving axial load		1) Crossed work rolls causing excessive axial load · Roll neck diameter is smaller than the standard one. · Chock side liner is worn. · Inaccuracy of mill stand. · Rigidity of the chock is poor. · Corrosion on liner or clearance generated between the liner and the chock. · Failure of the keeper plate.	1) Keep the correct locations of the chock and work roll.
	 Outer ring raceway of four-row tapered roller bearing	Flaking generated and developed from raceway end face		1) Looseness of chock cover/excessive axial clearance As the axial clearance is increased, the loading range becomes narrower, partial load acts, and edge load is generated on the outer ring raceway. 2) Excessive axial clearance is generated because of the mixed use of other bearing spacer or outer ring.	1) Adjust shims, select thickness of shims, measure a gap, and tighten bolts correctly. 2) Use parts of the same number.
	Flaking caused by improper mounting Loading position (1) Loading position (2)  Loading position (3) Loading position (4) Outer ring raceway of four-row tapered roller bearing	Flaking on raceway surface with slanted contact		1) It occurs when the chock is fixed inappropriately and slantingly. · Failure of keeper plate Removal, looseness, damage, deformation, bend, unequal tightening, unequal wear, improper parallelism · Damaged, deformed, or bent chock flange	1) Find the cause of damage by periodic inspection of the chock and stand.
	 Flaking at corroded start point Outer ring raceway of four-row tapered roller bearing	Flaking on raceway surface started from corroded (rusted) portion		1) After the bearing was used, it has been left for a long period with moisture mixed in grease. 2) Improper rust preventive treatment after the bearing was washed. 3) Worn or damaged seal lips 4) Corrosion on the raceway is generated due to the clearance between the roll neck and the sleeve, and flaking occurs with rust.	1) Improve seal maintenance and sealing method. Periodically check for wear or damage on the seal lips. 2) Fit the “O” ring between the roll neck and the sleeve. 3) Immediately after the bearing is removed from the chock, change grease. 4) After washing the bearing, remove kerosene and water completely.

Table 7-1 (2) Bearing failures, causes and countermeasures

Failures	Characteristics	Damages		Causes	Countermeasures
(1) Flaking	 Flaking on nicks (scratch) start point Rolling contact surface of four-row cylindrical roller bearing	Flaking on rolling contact surface with nicks start point		1) Inappropriate handling · Mounting / dismounting bearing to / from chock · Replacing roll	1) Proper handling jig (use of a copper hammer) 2) Prevention of impact load when replacing roll (use of soft material) 3) Improvement in mounting method 4) Change in raceway chamfering
	 Outer ring raceway of double-row cylindrical roller bearing  Inner ring raceway of double-row cylindrical roller bearing  Inner ring raceway of double-row cylindrical roller bearing	Flaking on raceway surface		1) Low viscosity lubrication (improper lubrication) 2) Ingress of dusts and foreign matters	1) Improvement in viscosity of oil and oil type 2) Improvement in seal maintenance and sealing method Periodic check of wear or damage of seal lip 3) Check of oil filter
(2) Cracking Chipping	 Inner ring side face of four-row tapered roller bearing	Minute crack on inner ring side face		1) Fix the inner ring and the roll with a fillet ring (thrust collar). 2) Clearance between the fillet ring (thrust collar) and the inner ring is excessively small. 3) Area of the side face of nut/slinger contacting the inner ring side face is too small, the side face is worn due to inner ring creep, causing heat.	1) Keep the clearance between the inner ring and the fillet ring (thrust collar) (from 0.5 mm to 1.5 mm). 2) Keep the area of the side of fillet ring (thrust collar) (to reduce pressure on the side face). 3) Apply and supply grease of adequate amount.
	 Rolling contact surface of four-row cylindrical roller bearing	Cracking on rolling elements		1) Application of load greater than bearing load rating (Load resistance of roller by use of pin type cage) 2) Secondary factor in case of damaged pin of cage (For a reversible mill, pins are broken due to fatigue caused by rapid acceleration and deceleration) 3) Other factors · Ingress of water due to faulty sealing · Increase of axial clearance of bearing, causing application of partial and excessive load	1) Optimal design of bearing considering load and operating conditions (Examination of optimal cage type) 2) Reviewing sealing method and design of strength of cover

Table 7-1 (3) Bearing failures, causes and countermeasures

Failures	Characteristics	Damages		Causes	Countermeasures
(2) Cracking Chipping	 Outer ring outside surface of double-row cylindrical roller bearing  Outer ring side face of double-row cylindrical roller bearing  Outer ring outside of double-row cylindrical roller bearing	Crack on outer ring		1) Impact load acting due to accidents of rolling mill (for example, plate being caught in, ingress of dusts) 2) Rolling load acting unevenly due to uneven overall thickness of bearing in the shaft, causing excessive load to a thick section bearing (for multi-roll mill, BUR bearing)	1) Change to outer ring material or heat treated material hard to be cracked. 2) Appropriate overall thickness control of bearings in a shaft
	 Inner ring raceway of four-row cylindrical roller bearing  Inner ring raceway of four-row cylindrical roller bearing	Grinding burn or crack on inner ring raceway surface		1) After fitting an inner ring into the roll neck, grinding burn occurs during grinding with the inner ring and the roll. 2) Crack occurs because rollers rolling on the raceway surface of which strength (hardness) is decreased due to grinding burn.	1) Reviewing grinding conditions Grain size of grinding stone, grinding stone cutting amount, cutting pressure, grinding fluid amount, etc.
	 Outer ring outside surface of double-row cylindrical roller bearing	Grinding burn or crack on outer ring outside surface		1) Grinding burn occurs when re-grinding the outer ring of a multi-roll mill bearing. 2) Crack occurs because the outer ring of which strength (hardness) is decreased by grinding burn contacts with the intermediate roll.	

Table 7-1 (4) Bearing failures, causes and countermeasures

Failures	Characteristics	Damages		Causes	Countermeasures
(2) Cracking Chipping	 Inner ring of spherical roller bearing  Fractured section of inner ring	Axial crack occurs on bore surface of inner ring and raceway surface.		1) Excessive interference between inner ring and shaft 2) Great fit stress due to excessive difference in temperature of inner ring and that of shaft	1) Appropriate fit conditions of inner ring and shaft 2) Appropriate difference in temperature by checking load, rotation, and temperature conditions. (appropriate fit)
	 Inner ring bore surface of four-row tapered roller bearing	Circumferential crack occurs on bore surface and raceway surface of inner ring.		1) Step wear occurs on the shaft (roll neck), and the inner ring overrides the shaft, causing great bore surface stress	1) Provide circumferential groove for the roll neck. 2) When using a bearing with different chamfers for a roll, make the chamfers identical.
	 Outer ring raceway of double-row tapered roller bearing  Fractured section of outer ring	Axial crack occurs on outside surface and raceway surface of outer ring.		1) Excessive axial load 2) Axial clearance between the bearing and roll is great, and excessive axial load is applied.	1) Check for axial load. 2) Check the wear condition of counterpart components. 3) Reviewing thickness of the outer ring
	 Inner ring raceway of spherical thrust roller bearing  Assembly of tapered roller bearing	Crack occurs on inner ring back face rib.		1) Excessive axial load 2) Low holding shoulder diameter on the inner ring back face rib	1) Reviewing operating conditions 2) Reviewing dimensions of counterpart collar (Dimensions allowing backup of inner ring back face rib)

Table 7-1 (5) Bearing failures, causes and countermeasures

Failures	Characteristics	Damages		Causes	Countermeasures
(3) Brinelling Nicks	 Outer ring raceway surface of four-row tapered roller bearing  Rolling contact surface of four-row cylindrical roller bearing	1) Brinelling (Nicks) on raceway and rolling contact surfaces (scratch) 2) Brinelling on raceway surface at the same interval as rolling element spacing		1) Nicks occur on the raceway and rollers because of improper handling. · Mounting / dismounting bearing to / from chock · Replacing roll 2) Great bending load is applied to the roll neck. (Especially, when faulty rolling occurs)	1) Proper handling jig (use of a copper hammer) 2) Application of grease to raceway surface of inner and outer rings (Apply oil if the bearing is the oil lubricated type) 3) Prevention of impact load when replacing roll (Use of soft material) 4) Roll bending compared to bearing static load rating 5) Improvement in mounting method 6) Change in raceway chamfering 7) Check for excessive load on the slant chamfer of the raceway surface
(4) Scratch Scuffing	 Roller end face of double-row cylindrical roller bearing  Outer ring rib of double-row cylindrical roller bearing  Roller large end face of double-row tapered roller bearing	Scuffing on roller end face and rib of the raceway		1) Improper lubrication, ingress of foreign matters 2) Abnormal axial load caused by improper mounting or control of bearing overall thickness 3) Excessive axial load 4) Excessive preload	1) Selection of appropriate oil type and supply of adequate lubricant 2) Reviewing bearing mounting location 3) Reviewing bearing overall thickness control 4) Reviewing operating conditions 5) Checking preload

Table 7-1 (6) Bearing failures, causes and countermeasures

Failures	Characteristics	Damages		Causes	Countermeasures
(5) Smearing	 Outer ring raceway surface of four-row tapered roller bearing  Outer ring raceway surface of spherical roller bearing  Outer ring raceway surface of spherical roller bearing  Rolling element surface of spherical roller bearing	Smearing on raceway or rolling contact surface		1) Improper lubrication 2) Slip of rolling elements (high speed, light load) 3) Ingress of foreign matters during maintenance	1) Selection of appropriate oil type and supply of adequate lubricant 2) Setup of appropriate preload 3) Prevention of ingress of foreign matters
(6) Corrosion Rust	Corrosion  Outer ring of four-row tapered roller bearing  Outer ring of four-row tapered roller bearing	Rust, corrosion on the raceway surface at the same interval as rolling element spacing		1) Worn or damaged seal lips 2) Ingress of water or corrosive materials into clearance between roll neck and sleeve	1) Improve seal maintenance and sealing method. Periodically check for wear or damage on the seal lips. 2) Fit the "O" ring between the roll neck and the sleeve.
	Rust  Outer ring of four-row tapered roller bearing	Rust on partial or entire surface of bearing		1) After the bearing was used, it has been left for a long period with moisture mixed in grease. 2) Improper rust preventive treatment after the bearing was washed.	1) Immediately after the bearing is removed from the chock, change grease. 2) After washing the bearing, remove kerosene and water completely.

Table 7-1 (7) Bearing failures, causes and countermeasures

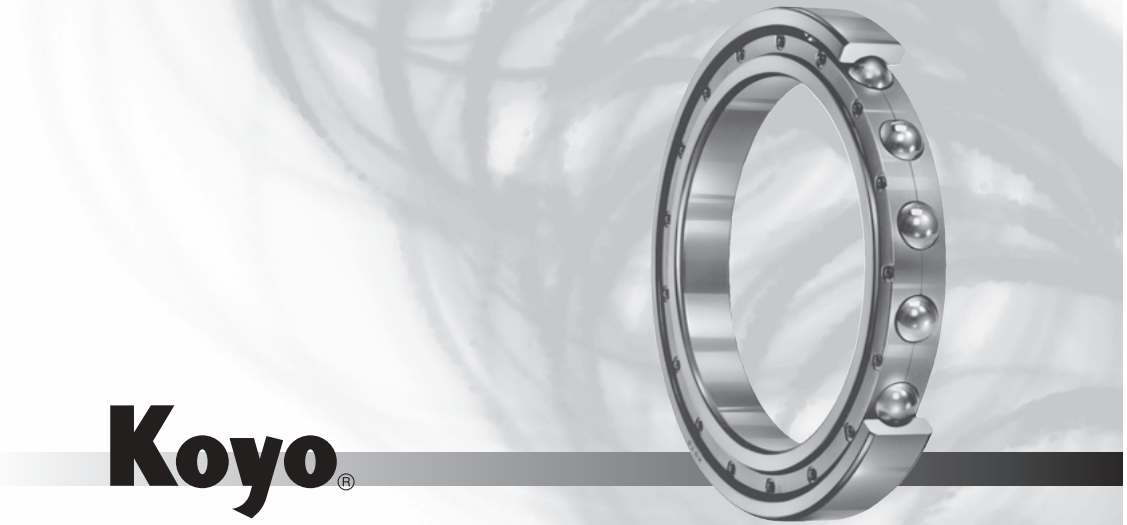
Failures	Characteristics	Damages		Causes	Countermeasures
(7) Creeping	 Scuffing on rolling mill roll neck   Inner ring bore surface of four-row tapered roller bearing	Wear, discoloration, and scuffing due to slip of fit surface		1) Insufficient grease or oil between the inner ring bore surface and the roll neck outside surface (When creep occurs between the inner ring and the roll neck, because of loose fit of them.)	1) Provide the spiral groove for bore surface of inner ring 2) When mounting the bearing, apply grease with molybdenum disulfide or EP grease. (Apply oil if the bearing is the oil lubricated type)
(8) Seizure	  Rolling contact surface of double-row tapered roller bearing Roller large end face of double-row tapered roller bearing  Inner ring of double-row tapered roller bearing	Discoloration, deformation, and melting caused by heat of bearing		1) Improper lubrication (insufficient or degraded lubricant) 2) Ingress of water due to faulty sealing 3) Excessive axial load 4) Heat generated by creep of inner ring 5) Ingress of dusts or foreign matters 6) Excessively small bearing internal clearance	1) Reviewing sealing type and conditions 2) Reviewing lubricating method and lubricant, and checking lubricated condition 3) Check for axial load 4) Reviewing bearing (type, size, etc.) 5) Reviewing clearance 6) Confirming operating conditions

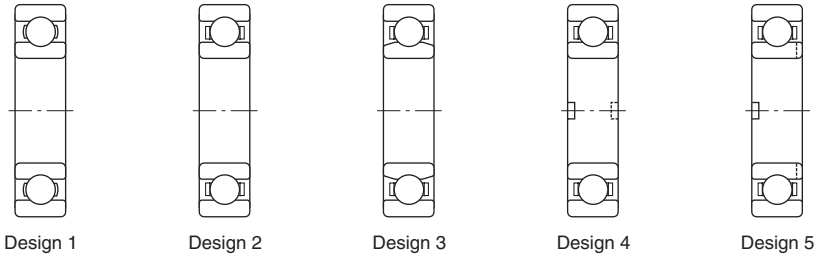
Table 7-1 (8) Bearing failures, causes and countermeasures

Failures	Characteristics	Damages		Causes	Countermeasures
(9) Failure in lubrication	 Inner ring assembly of four-row tapered roller bearing	Grease including large quantity of water mixed in		1) Operated at high temperature ⇒ Grease is carbonized. 2) Ingress of water due to improper sealing or wear or damage of seal lip (In this example, 20% or more of water is mixed in grease.)	1) Find the cause of high temperature. (If the temperature cannot be lowered, review the possibility of change to high temperature grease.) 2) Checking wear or damage of seal lip Find the cause of and countermeasure against the improper sealing.
	 Inner ring assembly of double-row tapered roller bearing  Outer ring of double-row tapered roller bearing	Foreign matter attachment and corrosion occur because of ingress of a great deal of foreign matters (scale and water for rolling).		1) Ingress of water due to improper sealing or wear or damage of seal lip	1) Checking wear or damage of seal lip Find the cause of and countermeasure against the improper sealing.
	 Four-row tapered roller bearing	Seizure and adhesion of raceway, roller, and cage		1) Varied factors including improper lubrication, improper operation, and ingress of foreign matters occur, causing damages.	1) Checking improper operation 2) Checking lubricating conditions 3) Checking degradation of peripheral parts
	 Outer ring assembly of four-row cylindrical roller bearing  Outer ring assembly of four-row cylindrical roller bearing	Looseness and breaking of pin		1) Abnormal load due to vibration occurs. 2) End of cage's service life because of use for a long period	1) Checking abnormal vibration 2) Replace if it has been used for a long period.

Bearing specification tables

Deep groove ball bearings





- Deep groove ball bearings can accommodate radial load and axial load in both directions.
- Suitable for operation at high speed, with low vibration.

Boundary dimensions	The dimensions of standard series are as specified in JIS B 1512.
Tolerances	As specified in JIS B 1514, class 0 or 6 (refer to Table 2-2 on page 14.)
Allowable misalignment	0.002 3 rad (8') – 0.003 4 rad (12')
Radial internal clearance	(refer to Table 4-2 on page 46)
Standard cages	Pressed cage (design 1) or machined cage (design 2 to 5).
Equivalent radial load	**Dynamic equivalent radial load** $P_r = XF_r + YF_a$ **Static equivalent radial load** $P_{0r} = 0.6F_r + 0.5F_a$ (when the value of $P_{0r} < F_r$, $P_{0r} = F_r$)

$\frac{f_0F_a}{C_{0r}}$	e	$\frac{F_a}{F_r} \leqq e$		$\frac{F_a}{F_r} > e$	
		X	Y	X	Y
0.172	0.19	1	0	0.56	2.30

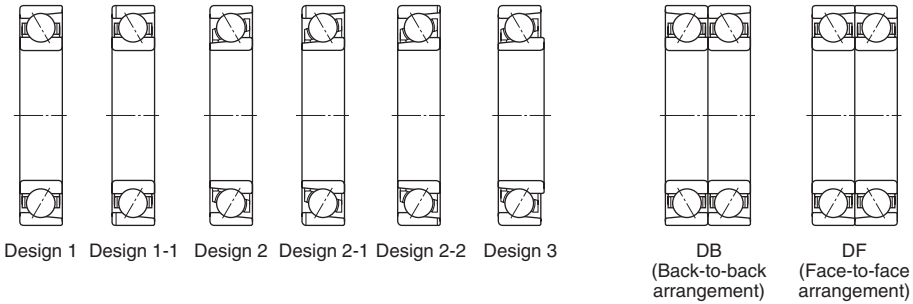
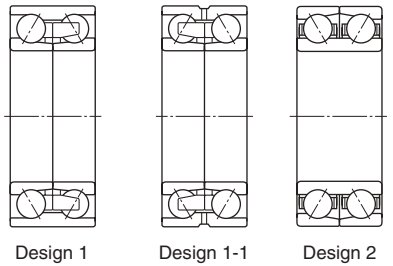
Angular contact ball bearings

Koyo®

■ Single-row, matched pair (page 100)



■ Double-row (page 112)



- Single-row bearings can accommodate radial load and axial load in one direction.
- DB and DF matched pair bearings and double-row bearings can accommodate radial load and axial load in both directions.
- Two or more single-row angular contact ball bearings are often combined in order to increase the load rating or rigidity. In this case, two types of arrangements, back-to-back arrangement (DB) and face-to-face arrangement (DF), are available. If the load rating of a single-row angular contact ball bearing is insufficient, use the tandem arrangement (DT).

Boundary dimensions	The dimensions of standard series are as specified in JIS B 1512-1995.
Tolerances	As specified in JIS B 1514, class 0 or 6. (refer to Table 2-2 on page 14.)
Contact angle (α)	The standard contact angles are 15°, 30° and 40°. Bearings with a smaller contact angle are more suitable for applications involving high-speed rotation. Those with a larger contact angle feature superior axial load resistance. (The standard contact angles of single-row and matched pair angular contact ball bearings) 15°·····supplementary code C 30°·····supplementary code A or no indication 40°·····supplementary code B [Note] Contact angles of double-row angular contact ball bearings are shown in specification tables.
Allowable misalignment	Single-row·····0.000 6 rad (2') : Matched pair, double-row·····misalignment not allowed
Internal clearance	(refer to Table 4-3 on pages 46, 47)
Standard cages	Machined cage

Equivalent radial load

Single-row and matched pair angular contact ball bearings

Dynamic equivalent radial load

$$P_r = XF_r + YF_a$$

Contact angle	$\frac{if_0F_a}{C_{0r}}$	e	Single-row and tandem (DT) arrangement				Back-to-back (DB) and face-to-face (DF) arrangement			
			$\frac{F_a}{F_r} \leqq e$		$\frac{F_a}{F_r} > e$		$\frac{F_a}{F_r} \leqq e$		$\frac{F_a}{F_r} > e$	
			X	Y	X	Y	X	Y	X	Y
$\alpha = 15°$	0.178	0.38	1	0	0.44	1.47	1	1.65	0.72	2.39
	0.357	0.40				1.40		1.57		2.28

	2.14	0.50				1.12		1.26		1.82
	3.57	0.55				1.02		1.14		1.66
	5.35	0.56				1.00		1.12		1.63
$\alpha = 30°$	–	0.80	1	0	0.39	0.76	1	0.78	0.63	1.24
$\alpha = 40°$	–	1.14	1	0	0.35	0.57	1	0.55	0.57	0.93

For i, use 2 for DB & DF and 1 for single & DT.
Factor f_0 is shown in the bearing specification table.

Static equivalent radial load

$$P_{0r} = X_0F_r + Y_0F_a$$

In reference to single-row and tandem arrangement bearings,
when $P_{0r} < F_r$
$P_{0r} = F_r$

Contact angle	Single-row and tandem (DT) arrangement		Back-to-back (DB) and face-to-face (DF) arrangement	
	X_0	Y_0	X_0	Y_0
$\alpha = 15°$	0.5	0.46	1	0.92
$\alpha = 30°$	0.5	0.33	1	0.66
$\alpha = 40°$	0.5	0.26	1	0.52

Double-row angular contact ball bearings

Dynamic equivalent radial load

$$P_r = XF_r + YF_a$$

Contact angle	e	$\frac{F_a}{F_r} \leqq e$		$\frac{F_a}{F_r} > e$	
		X	Y	X	Y
$\alpha = 30°$	0.80	1	0.78	0.63	1.24
$\alpha = 32°$	0.86	1	0.73	0.62	1.17

Static equivalent radial load

$$P_{0r} = X_0F_r + Y_0F_a$$

Contact angle	X_0	Y_0
$\alpha = 30°$	1	0.66
$\alpha = 32°$	1	0.63

Dynamic equivalent load calculation : when a pair of single-row angular contact ball bearings is arranged face-to-face or back-to-back.

While radial loads F_{rA} and F_{rB} are applied to bearings A and B, axial load K_a externally acts in the directions shown in the figures below.

[Remark]
When radial load is applied to a single-row angular contact ball bearing, axial load generated as an axial component of force acts on another bearing. The axial load can be obtained by the following equation.

$$F_a = \frac{F_r}{2Y}$$

Paired mounting	Loading condition	Bearing	Axial load	Dynamic equivalent load
Back-to-back arrangement 	$\frac{F_{rB}}{2Y_B} + K_a \geqq \frac{F_{rA}}{2Y_A}$	Bearing A	$\frac{F_{rB}}{2Y_B} + K_a$	$P_A = XF_{rA} + Y_A\left(\frac{F_{rB}}{2Y_B} + K_a\right)$ $P_A = F_{rA}$, where $P_A < F_{rA}$
		Bearing B	–	$P_B = F_{rB}$
Face-to-face arrangement 	$\frac{F_{rB}}{2Y_B} + K_a < \frac{F_{rA}}{2Y_A}$	Bearing A	–	$P_A = F_{rA}$
		Bearing B	$\frac{F_{rA}}{2Y_A} - K_a$	$P_B = XF_{rB} + Y_B\left(\frac{F_{rA}}{2Y_A} - K_a\right)$ $P_B = F_{rB}$, where $P_B < F_{rB}$
Back-to-back arrangement 	$\frac{F_{rB}}{2Y_B} \leqq \frac{F_{rA}}{2Y_A} + K_a$	Bearing A	–	$P_A = F_{rA}$
		Bearing B	$\frac{F_{rA}}{2Y_A} + K_a$	$P_B = XF_{rB} + Y_B\left(\frac{F_{rA}}{2Y_A} + K_a\right)$ $P_B = F_{rB}$, where $P_B < F_{rB}$
Face-to-face arrangement 	$\frac{F_{rB}}{2Y_B} > \frac{F_{rA}}{2Y_A} + K_a$	Bearing A	$\frac{F_{rB}}{2Y_B} - K_a$	$P_A = XF_{rA} + Y_A\left(\frac{F_{rB}}{2Y_B} - K_a\right)$ $P_A = F_{rA}$, where $P_A < F_{rA}$
		Bearing B	–	$P_B = F_{rB}$

[Remarks] 1. These equations can be used when internal clearance and preload during operation are zero.
2. Radial load is treated as positive in the calculation, if it is applied in a direction opposite that shown in Fig. above

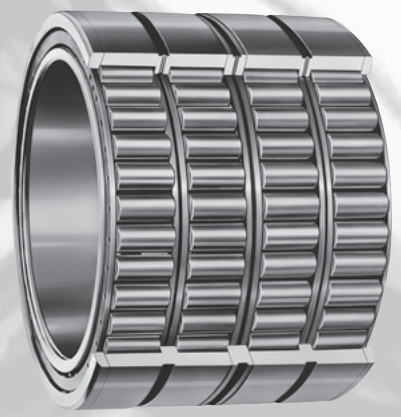
[Note] 1) Bearing No.305275-1 and 305262-1 indicate nominal contact angle of 32°. Bearing No. 2AC2419B, 305180-1, 305172B-1, and 2AC4432B-1 indicate nominal contact angle of 40°, and nominal contact angle of other bearings is 30°.
[Remark] 1) Some of these bearings have lubrication grooves or lubrication holes on their outer rings.

Cylindrical roller bearings

- Cylindrical roller bearings feature high radial load capacity because the rollers and raceway are in linear contact. These bearings are suitable for applications that involve heavy radial and impact loading.
- They are appropriate for high-speed applications in that they can be machined very accurately due to their structure.
- The NU and N types exhibit their best performance when used as free side bearings since they adjust to the shaft's axial movement, to a certain extent, relative to the housing position.
- The NJ and NF types carry axial load in one direction, while the NUP type can carry a certain degree of axial load in both directions.



- Double-row cylindrical roller bearings come in two types : with a cylindrical bore, and with a tapered bore. As for those with a tapered bore, the specified amount of clearance can be obtained by adjusting the press-in distance.
  Some bearings have lubrication holes and lubrication grooves on the outer ring. They are identified by supplementary code "W".

- Four-row cylindrical roller bearings, having superior resistance to radial load, are suitable for use at a high-speed.
- Since the inner ring raceway surface and the roll can be finished simultaneously after the inner ring is mounted on the roll neck (the inner ring raceway surface is grounded by a roll grinding machine, and then, the roll barrel is finished based on the grounded surface), rolling accuracy is improved. Additionally, residual clearance of the bearing can be adjusted freely.
- Some four-row cylindrical roller bearings have nozzle holes and O-rings for oil mist lubrication.

Boundary dimensions

The dimensions of standard series are as specified in JIS B 1512.

Tolerances

As specified in JIS B 1514.
- Single-row, double-row and four-row cylindrical bore bearings···Classes 0, 6 and 5
- Four-row tapered bore bearings···Classes 0 and 6 (refer to Table 2-2 on page 14)

Tolerances of roller set bore diameter F_w and roller set outside diameter E_w of interchangeable bearings

Unit : μm

Nominal bore diameter d (mm)		Roller set bore diameter deviation Δ_{Fw}		Roller set outside diameter deviation Δ_{Ew}	
over	up to	upper	lower	upper	lower
50	120	+ 20	0	0	− 20
120	200	+ 25	0	0	− 25
200	250	+ 30	0	0	− 30
250	315	+ 35	0	0	− 35
315	400	+ 40	0	0	− 40
400	500	+ 45	0	0	− 45
500	600	+ 50	0	0	− 50
600	700	+ 55	0	0	− 55
700	800	+ 60	0	0	− 60
800	900	+ 70	0	0	− 70
900	1 000	+ 80	0	0	− 80
1 000	1 250	+ 90	0	0	− 90
1 250	1 600	+100	0	0	−100
1 600	2 000	+120	0	0	−120
2 000	2 500	+150	0	0	−150

[Remark] Interchangeable bearings have an inner ring with rollers that can be matched with the outer ring, or an outer ring with rollers that can be matched with the inner ring, without affecting performance in the bearing that has the same bearing number in one category.

Allowable misalignment

Allowable misalignment of single-row cylindrical roller bearings depends on bearing type and specification.
General values are as follows :

1) When P_r / C_r is approx. 10% under load of normal use
·····0.000 6 rad (2') − 0.000 9 rad (3')

2) When P_r / C_r is approx. 6% under load lighter than 1)
·····0.001 2 rad (4')

When very large allowable misalignment is required, consult with JTEKT.

Radial internal clearance

(refer to Table 4-4 on pages 47, 48)

Standard cages

Machined cage or pin type cage

Equivalent radial load

Dynamic equivalent radial load ····· $P_r = F_r$

Static equivalent radial load ····· $P_{0r} = F_r$

Allowable axial load

Cylindrical roller bearings with ribs, including loose rib, on both inner and outer rings accommodate axial load to a certain extent.
In such cases, axial load capacity is controlled by the condition of roller end faces, forms of rib or loose rib, lubrication, rotational speed etc.
For certain special uses, a design is available to accommodate very heavy axial loads. In general, axial loads allowable for cylindrical roller bearings can be calculated using the following equation, which are based on empirical data.

$$F_{ap} = 9.8 f_a \cdot f_b \cdot f_p \cdot d_m^2$$

where :

F_{ap} : maximum allowable axial load N

f_a : coefficient determined from loading condition (see below)

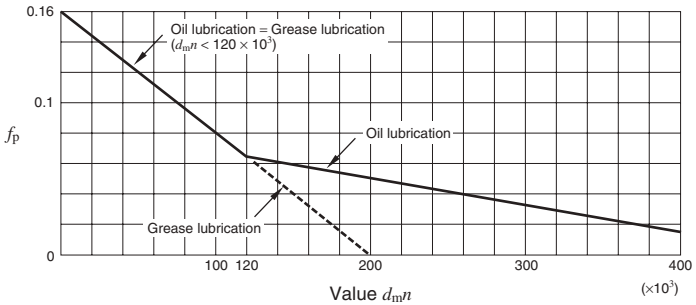
f_b : coefficient determined from bearing diameter series (see below)

f_p : coefficient for rib surface pressure (see below)

d_m : mean value of bore diameter d and outside diameter D ··· $\left(\frac{d+D}{2}\right)$ mm

Loading condition	f_a
Continuous loading	1
Intermittent loading	2
Instantaneous loading	3

Diameter series	f_b
8	0.4
9	0.6
0	0.7
2	0.8
3	1.0
4	1.2



Relationship between coefficient f_p and value $d_m n$ (n : rotational speed, $\min^{-1}$)

[Note] 1) For bearings other than NU type bearings (NJ, NUP, N, and NF types), use NJ, NUP, N, and NF for bearing number instead of supplementary code NU. For example, bearing number of a N type bearing having the same dimensions as NU230 is N230.

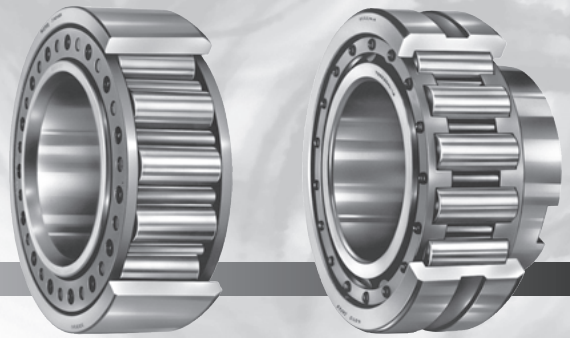
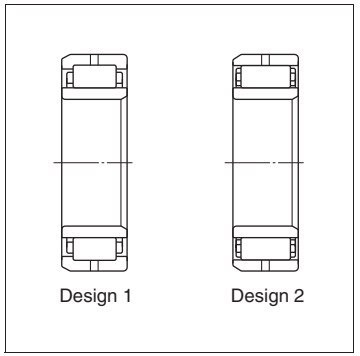
Wide series cylindrical roller bearings

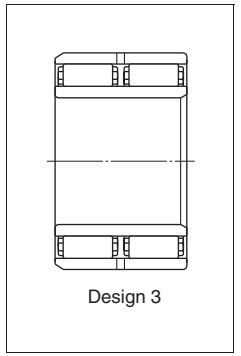


Koyo®

■ 99, W99, SW99 series

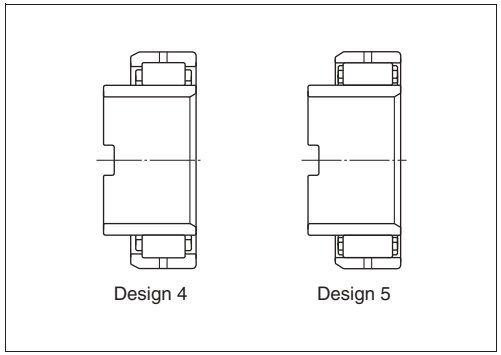


■ D99 series



- This type has high radial load capacity, and so, is suited to heavy duty applications or where shock loading is expected.
- Outer ring is available either with or without ribs, either of which is provided with two lubrication holes.
  Some bearings have four lubrication holes.

■ T99 series ····· For line shaft



- This is a type equivalent to the above bearing except for extended inner ring provided with a key way.
- Applicable to such applications where large axial movement of the inner ring is involved, and mainly used for line shafts of rolling mill table rollers.

Tolerances	Consult with JTEKT, as bearings are manufactured at special tolerance corresponding to each application of bearing. Tolerances generally correspond to class 0 or class 6 specified in JIS B 1514 (See Table 2-2 given on page 14).
Radial internal clearance	(Refer to Table 4-4 on page 47)
Equivalent radial load	**Dynamic equivalent radial load** ··· $P_r = F_r$ **Static equivalent radial load** ····· $P_{0r} = F_r$

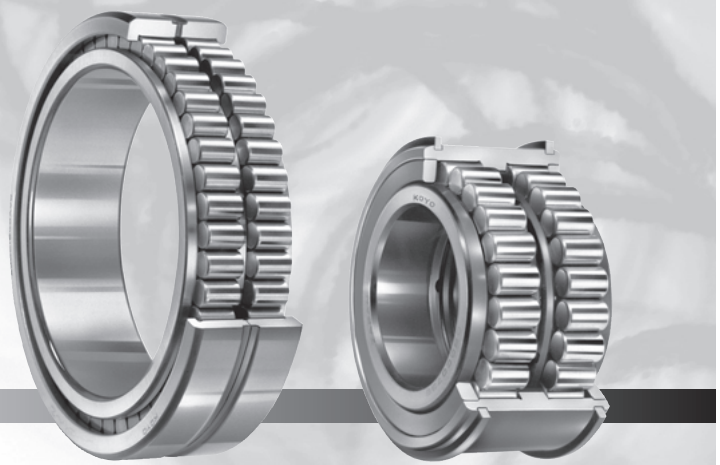
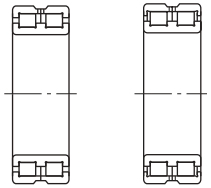
Full complement cylindrical roller bearings for crane sheaves

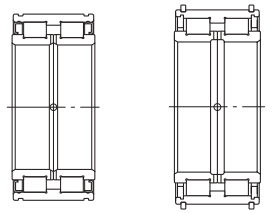


Koyo®

■ Double-row, open type (page 178)



■ Double-row, shielded type (page 182)



- Since full complement type cylindrical roller bearings can incorporate more rollers than bearings with cage, the load rating can be increased.
- Bearings on the fixed side is capable of withstanding radial load and axial load in both directions.
- The shielded bearing is specially designed for crane sheaves ;
  - ○ Prelubricated with high quality grease.
  - ○ Shield plates are located. (The rubber seal can be employed according to the operating conditions.)
  - ○ The bearing surfaces are coated with phosphate to prevent rusting.

Bowndary dimensions	As specified in JIS B 1512.
Tolerances	As specified in JIS B 1514, class 0 or 6. (refer to Table 2-2 on page 14.)
Recommended fits and radial internal clearance	• Recommended fits: refer to Table 3-3 on pages 35, 36. ■ Fits and clearance of full complement type cylindrical roller bearings for use with crane sheaves with the rotating outer ring load

Condition		Shaft tolerance class	Housing bore tolerance class
Rotating outer ring load	Light or fluctuating load Normal or heavy load Heavy load on thin section housing	g 6 or h 6	M 7 N 7 P 7

Refer to Table 4-4 on page 47.
As for the nominal bore dia. up to 140 mm shielded type (DC5000 series), the corresponding CN clearance are shown below.

Nominal bore dia. d (mm)			CN clearance (μm)	
over		up to	min.	max.
30	–	40	35	70
40	–	50	40	75
50	–	65	45	90
65	–	80	55	105
80	–	100	65	115
100	–	120	80	120
120	–	140	90	130

Allowable axial load	The above fixed side bearings whose inner and outer rings have ribs can accommodate a certain magnitude of axial load. As for the equation to calculate allowable axial load in this case, refer to page 119.
Equivalent radial load	**Dynamic equivalent radial load** ····· $P_r = F_r$ **Static equivalent radial load** ····· $P_{0r} = F_r$

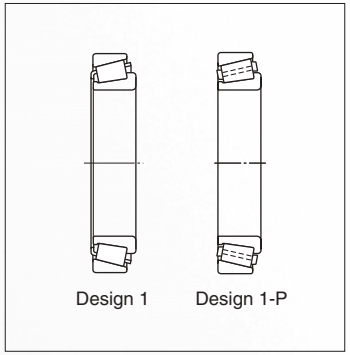
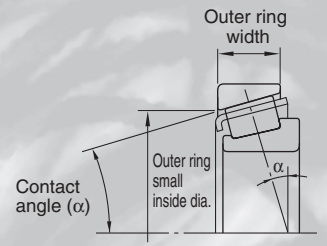
Tapered roller bearings

■ Single-row
(page 192)



- Able to carry radial and axial load in one direction simultaneously. Combined radial and axial load can be also accommodated. Suitable for heavy load and impact load.
- The larger the contact angle (α) is, the greater the bearing resistance to axial load.
  {Steep angle type ··· $\alpha \geqq 25°$ (constant $e \geqq 0.67$)}
- Koyo tapered roller bearings whose bearing numbers are suffixed by "J" are precision ground in accordance with the ISO 355 (Sub-unit, Metric Series) specifying the outer ring width and small inside diameter as well as the contact angle, so that outer rings and inner ring assembly (inner ring, rollers and cage assembly) of these bearings are internationally interchangeable.



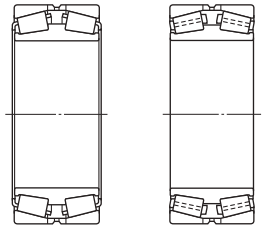
ISO sub-unit specifications

[Note] When supplementary code "J" is added as a prefix (not a suffix) to bearing numbers (e.g. JHM720249/JHM720210), the bearings are not designed according to ISO 355.
Such bearings are called "J series metric tapered roller bearings," and are produced according to special tolerances.

Koyo®

■ Double-row (Face to face)

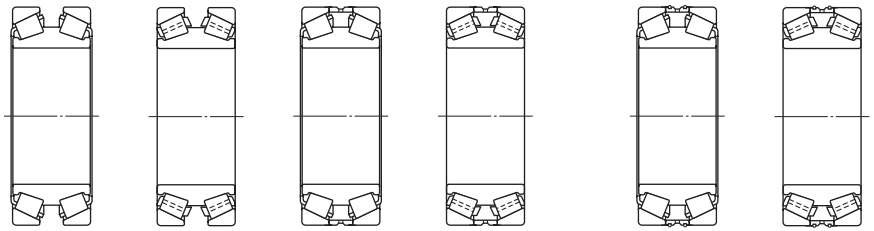
TDI type (page 230)



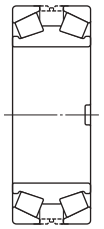
- The TDI type bearing is made up of two single-row outer rings and one double inner ring, and is generally provided with an outer ring spacer.
  The bearing with outer ring spacer is handy for mounting, as its end play has been pre-adjusted for each application.
- The spacer is provided with an lubrication groove and several lubrication holes.
- Used for roll neck of medium-duty rolling mills, speed reducers, etc.

TDIS type ····· For axial suport (page 250)

(For oil mist lubrication)

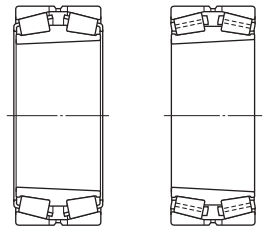


- The TDIS type bearing is of the same construction as the TDI type, except that it has larger contact angle so that it can accommodate heavier axial load.
- Used for applications where the axial load is greater than the radial load or where only the axial load is applied.
  The bearing with the key way on the inner ring is mainly used for rollling mill roll necks. The bearing may be also used with preload without using the outer ring spacer.
- The bearing having lubrication holes and O-rings on its outer ring is used for oil mist lubrication.



Example of key way

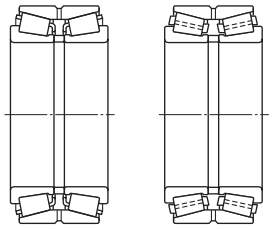
TDIT type ····· Tapered bore (page 260)



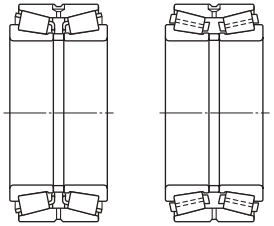
- Where the interference fit is necessary, and needs to be removed frequently, the use of TDIT type is convenient.
  It is also possible to mount the bearing on the shaft by using an adaptor sleeve.
- Used for roll neck of light or medium-duty rolling mills and roll neck of calendar mills.
- The use of a hydraulic unit will facilitate bearing mounting/dismounting.
- The roll neck taper needs to be matched to the bore diameter of bearing by using taper gauge, sign bar gauge, etc.

■ Double-row (Back to back)

TDO, TDOS type (page 264)



Design 1 Design 1-P

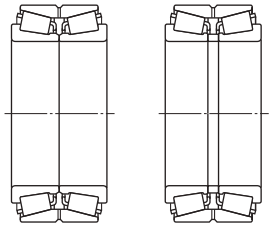


Design 2 Design 2-P

- The TDO type bearing is made up of one double outer ring, two single-row inner rings and one inner ring spacer. The outer ring is provided with several lubrication holes.
- The inner ring spacer has been adjusted to provide an end play suitable to each application. It is also possible to freely adjust the end play for use by removing the inner ring spacer, however, it requires time and labor.
- Suitable to case where moment may act. Used for speed reducer, winding machine, etc.

- The steep angle type (TDOS type) having large contact angle has increased axial load capacity, and is widely used for worm shaft of medium, heavy duty applications, thrust bearing of reducers etc.

TNA type (page 310)



Design 1 Design 2
(with inner ring spacer)

- The TNA type bearing has different assembled width tolerance from the TDO type, specially selected for the TNA type.

[Reference] Features of bearing with pin type cage

(1) Load rating can be increased.
The pin type cage accommodates a larger number of rollers, thus making it possible to increase the load rating of bearing.

(2) Reduced friction resistance
Friction coefficient of pin type cage is reduced, as contact area of roller and cage is limited.

(3) Easy mounting/dismounting
The pin type cage is provided with a tap hole for lifting.
The use of tap hole will facilitate the work.
Use ISO metric thread for lifting tap screw.

■ Four-row

TQO type (page 314)

(For oil mist lubrication)

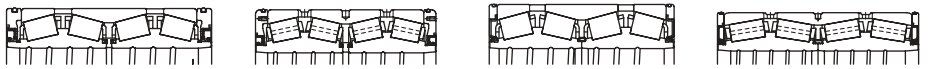
Sealed type (page 352)



Design 1 Design 1-P Design 2 Design 2-P

- The four-row tapered roller bearing with cylindrical bore is designed to maximize the load capacity with minimum space, and is widely used for roll neck of lower, medium speed rolling mills.
- The bearing of this type is made up of one double outer ring, two single-row outer rings, two double inner rings and inner ring spacer/outer ring spacer.
  Since each component is not interchangeable, it is necessary to assemble each component as specified with care taken to the matching marks marked on the bearing.
- Since the internal clearance has been preadjusted, the bearing can be used with ease without any necessity of readjustment.
- Since the bearing needs to be removed frequently and is clearance-fitted to the roll neck, the inner ring spacer is hardened to avoid wear.
  The lubrication grooves are provided on both sides of the inner ring spacer to allow the lubricant to be readily passed to the roll neck.
  The lubrication groove and lubrication holes are provided at the outside diameter of double outer ring and outer ring spacer.
- The bearing provided with lubrication holes and O-rings on the outer ring is used for oil mist lubrication.
- Sealed type four-row tapered roller bearings have oil seals on their side faces and in between inner rings, and O-rings on their outside surfaces to achieve the purposes below.
  - Reduction in frequency of disassembly, washing, and reassembly
  - Improvement in working environment of disassembly, washing, and reassembly
  - Reduction in grease consumption
  - Improvement in ambient surrounding rolling mills
- Design 2 shows the compact oil seal type to increase the load rating of a four-row tapered roller bearing. The intermediate seal in the Design 2 has advantages below.
  - Compact
  - Easy disassembly, washing, and reassembly

[Applicable tolerance for tapered roller bearings]

Type of tapered roller bearings			Applicable tolerance*
Single-row	Metric series	32900JR, 32000JR, 33000JR, 33100JR 30200JR, 32200JR, 33200JR, 30300JR 31300JR, 32300JR	Class 0, class 6, class 6X, or class 5 of JIS B 1514 (Refer to Table 2-3 on page 18)
	Inch series	(56418/56650, HM125943/HM125910 etc.)	Class 4, class 2 or class 3 of ABMA 19 (Refer to Table 2-5 on page 22)
	Metric J series	(JHM720249/JHM720210 etc.)	Class PK, class PN or class PC (Refer to Table 2-6 on page 24)
Double-row · Four-row	Metric series	45200, 45300, 46200(A), 46300(A) 46T30200JR, 46T32200JR, 46T30300JR, 46T32300JR 37200, 47200, 47300	Class 0 of BAS 1002 (Refer to Table 2-4 on page 21)
	Inch series	(LM377449D/LM377410, 67388/67322D EE127094D/127138/127139D etc.)	Class 4 of ABMA 19 (Refer to Table 2-5 on page 22)
	The others	45T···, 46T···, 47T···, 2TR···, 4TR···	Special tolerances for required are used in many cases. Consult with JTEKT.

* Consult with JTEKT if a higher tolerance class than that shown in this table is necessary.

Allowable misalignment	Single-row tapered roller bearings : 0.000 9 rad (3') (If the misalignment exceeds this angle size, JTEKT is ready to design special bearings to order.)		
Radial internal clearance	(refer to Table 4-5 on page 49) ····· Radial internal clearance of double-row and four-row tapered roller bearings		
Standard cage	Pressed cage or pin type cage		
Equivalent radial load [Note] Refer to the bearing specification table for the values of axial load factors Y_1, Y_2, Y_3 and Y_0 and constant e.	**Single-row**	**Dynamic equivalent radial load**	$\left(\text{when } \frac{F_a}{F_r} \leqq e\right)\ P_r = F_r$ $\left(\text{when } \frac{F_a}{F_r} > e\right)\ P_r = 0.4F_r + Y_1F_a$
		Static equivalent radial load	$P_{0r} = 0.5F_r + Y_0F_a$ when $P_{0r} < F_r$, $P_{0r} = F_r$
	Double-row · four-row	**Dynamic equivalent radial load**	$\left(\text{when } \frac{F_a}{F_r} \leqq e\right)\ P_r = F_r + Y_2F_a$ $\left(\text{when } \frac{F_a}{F_r} > e\right)\ P_r = 0.67F_r + Y_3F_a$
		Static equivalent radial load	$P_{0r} = F_r + Y_0F_a$

Dynamic equivalent load calculation : when a pair of single-row tapered roller bearings is arranged face-to-face or back-to-back.

While radial loads F_{rA} and F_{rB} are applied to bearings A and B, axial load K_a externally acts in the directions shown in the figures below.

[Remark]
When radial load is applied to a single-row tapered roller bearing, axial load generated as an axial component of force acts on another bearing. The axial load can be obtained by the following equation.

$$F_a = \frac{F_r}{2Y_1}$$

Paired mounting	Loading condition	Bearing	Axial load	Dynamic equivalent load
Back-to-back arrangement  	$\frac{F_{rB}}{2Y_B} + K_a \geqq \frac{F_{rA}}{2Y_A}$	Bearing A	$\frac{F_{rB}}{2Y_B} + K_a$	$P_A = XF_{rA} + Y_A\left(\frac{F_{rB}}{2Y_B} + K_a\right)$ $P_A = F_{rA}$, where $P_A < F_{rA}$
		Bearing B	–	$P_B = F_{rB}$
Face-to-face arrangement  	$\frac{F_{rB}}{2Y_B} + K_a < \frac{F_{rA}}{2Y_A}$	Bearing A	–	$P_A = F_{rA}$
		Bearing B	$\frac{F_{rA}}{2Y_A} - K_a$	$P_B = XF_{rB} + Y_B\left(\frac{F_{rA}}{2Y_A} - K_a\right)$ $P_B = F_{rB}$, where $P_B < F_{rB}$
Back-to-back arrangement  	$\frac{F_{rB}}{2Y_B} \leqq \frac{F_{rA}}{2Y_A} + K_a$	Bearing A	–	$P_A = F_{rA}$
		Bearing B	$\frac{F_{rA}}{2Y_A} + K_a$	$P_B = XF_{rB} + Y_B\left(\frac{F_{rA}}{2Y_A} + K_a\right)$ $P_B = F_{rB}$, where $P_B < F_{rB}$
Face-to-face arrangement  	$\frac{F_{rB}}{2Y_B} > \frac{F_{rA}}{2Y_A} + K_a$	Bearing A	$\frac{F_{rB}}{2Y_B} - K_a$	$P_A = XF_{rA} + Y_A\left(\frac{F_{rB}}{2Y_B} - K_a\right)$ $P_A = F_{rA}$, where $P_A < F_{rA}$
		Bearing B	–	$P_B = F_{rB}$

[Remarks] 1. These equations can be used when internal clearance and preload during operation are zero.
2. Radial load is treated as positive in the calculation, if it is applied in a direction opposite that shown in Fig. above table.

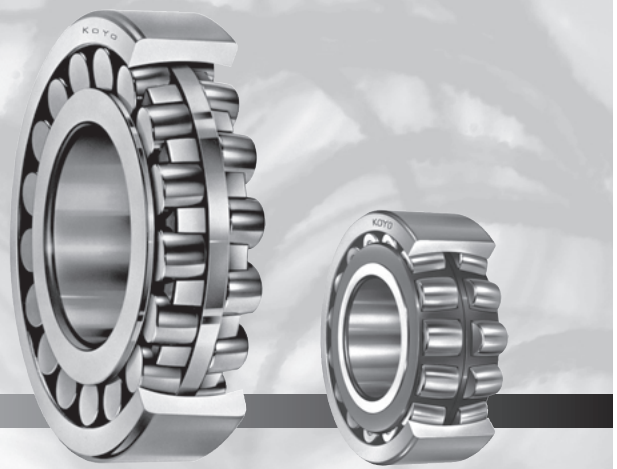
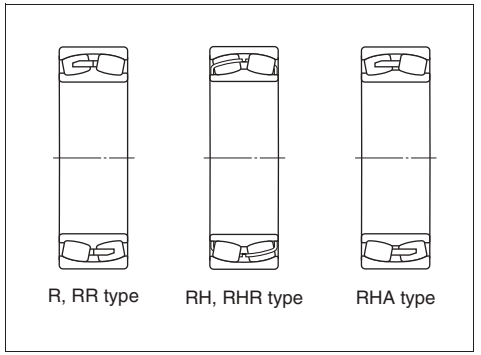
Spherical roller bearings

- Spherical roller bearings feature a large load rating capacity. This type of bearing is suitable for low- or medium-speed applications which involve heavy or impact loading.
- The spherical roller bearing is self-aligning, insensitive to misalignment of the shaft relative to the housing, and to shaft bending.
- Bearing with tapered bore can be easily mounted/dismounted by using an adapter assembly or withdrawal sleeve.
  1) 240 and 241 series ..... 1 : 30 (supplementary code K30)
  2) Others ..... 1 : 12 (supplementary code K)



■ Cylindrical bore



■ Tapered bore

	R, RR type	RH, RHR type	RHA type
Roller	Convex asymmetrical roller	Convex symmetrical roller	Convex symmetrical roller
Cage	Copper alloy prong type machined cage	Pressed steel cage	Copper alloy integral type machined cage
Inner ring (with or without rib)	With center rib	Without center rib (floating guide ring)	Without center rib (floating guide ring)
	With ribs on both sides (to prevent rollers from falling)	Without ribs on both sides	With ribs on both sides (to prevent rollers from falling)
Characteristics	Superior to RH, RHR and RHA types in high-speed performance.	The load rating capacity is larger than that of R and RR type. (There are some exceptional cases due to different interior specifications.)	

- Outer rings can be provided with lubrication holes, a lubrication groove and an anti-rotation pin hole.

Supplementary code		Number of lubrication holes	Hole layout
With lubrication holes and lubrication groove	With lubrication holes, lubrication groove and anti-rotation pin hole		
W33	**W3N**	3[1)]	3 equally spaced positions[1)]

[Remark] For bearings with lubrication holes and lubrication grooves on the outer ring, refer to page 367 and 368.

Thrust ball bearings

■ Single direction

Design 1

Design 2

- Axial load can be accommodated in one direction.
- Although it is designed to carry high axial load, is not suitable for high-speed operation.
- The rolling elements normally contacts the shaft washer (or housing washer) with contact angle 90°.

Boundary dimensions	As specified in JIS B 1512.
Tolerances	As specified in JIS B 1514, class 0 or 6. (refer to Table 2-7 on page 26.)
Allowable misalignment	Misalignment not allowed.
Amount of preload for thrust ball bearings	When a thrust ball bearing is rotated at high speed, balls slide on raceway due to centrifugal force and the gyro moment, which often causes the raceway to suffer from smearing or other defects. To eliminate such sliding, it is necessary to mount the bearing without clearance, and apply an axial load (preload) larger than the minimum necessary axial load determined by the following equation. $F_{a\,min} = 5.1 \left(\frac{n}{1\,000}\right)^2 \cdot \left(\frac{C_{0a}}{1\,000}\right)^2 \times 10^{-3}$ ····· (contact angle : 90°) where : $F_{a\,min}$: minimum necessary axial load N n : rotational speed min^{-1} C_{0a} : static axial load rating N When an axial load from the outside is lower than 0.001 3 C_{0a}, there is no adverse effect on the bearing, as long as lubrication is satisfactory. Generally, deep groove and angular contact ball bearings are recommended for applications when a portion of rotation under axial load is present at high speed.
Standard cages	Pressed cage (Design 1) or machined cage (Design 2)
Equivalent axial load	**Dynamic equivalent axial load** ····· $P_a = F_a$ **Static equivalent axial load** ····· $P_{0a} = F_a$

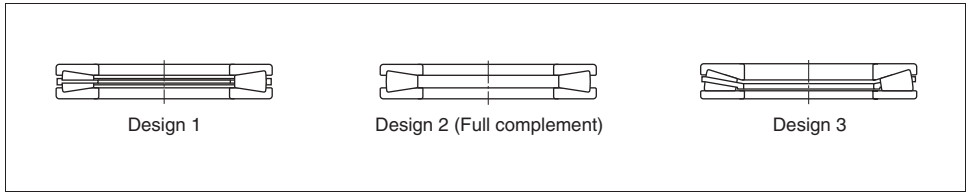
Tapered roller thrust bearings

Koyo®

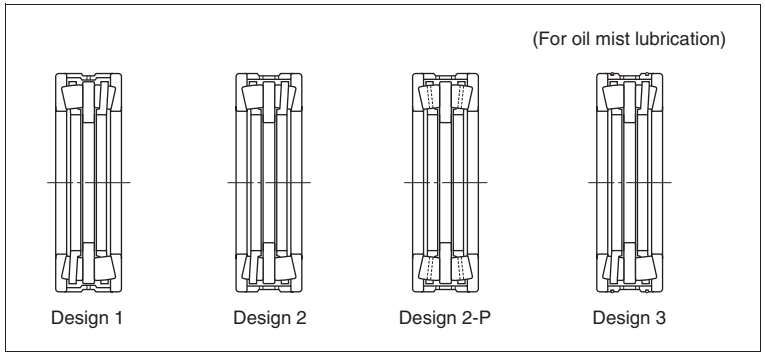
- Tapered roller thrust bearings come in three types, single direction type, double direction type, and screw-down spindle type (single direction full complement type). They suitable for extremely heavy axial load and impact load.
- The housing washer and shaft washer raceways are so designed that the extension lines of both raceways intersect at one point on the bearing centerline axis which promotes geometrically true rolling motion of the rolling elements.
- The contact areas between the rib provided for shaft washer and/or housing washer and the spherically ground roller large end face are designed so that the rollers can be guided securely, and proper oil film is formed.

■ Single direction (page 404)



- Bearings having ribs for both shaft and housing washers are suitable for the locations where the bearings can be securely fixed in radial direction, and mainly used for crane hook and swivel of oil excavator.
- If extremely heavy axial load is required, use the full complement type bearings (Design 2).
- Bearings having flat housing washer raceway (Design 3) allow some misalignment of shaft (against housing hole) during rotation.

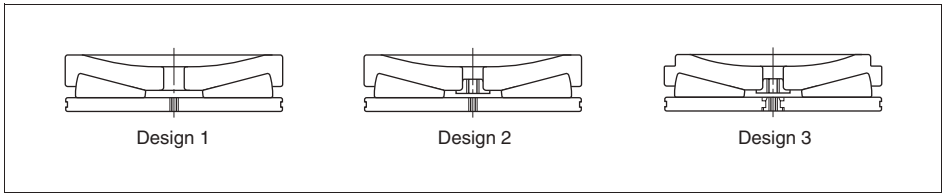
■ Double direction (page 408)



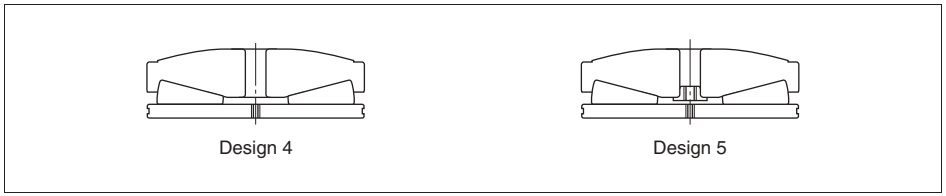
- The bearing of this type can support axial load in both directions, and is mainly used to support the axial load on roll neck of rolling mills.
- Since the shaft washer is treated with a clearance fit to the shaft, the shaft washer must be tightened and fixed securely with a sleeve.
- The axial clearance is commonly adjusted by means of spacer. The bearing without spacer is pre-loaded by spring, etc. for use.
- Some bearings have lubrication holes and O-rings on the spacer for oil mist lubrication.

■ For screw down spindles (Single direction full complement)

THR ··· Type (page 412)



THR ··· X Type (page 414)



- The bearings, suitable for low-speed and heavy load, have been designed for screw down spindles.
- The shaft washer surface is ground to convex or concave spherical surface to suit the profiles of the shaft end faces of screw-down spindles.
- Since the spherical shaft washer surface supports screw-down spindles, some misalignment of screw-down spindles during rotation is allowable.
  Some spindle runout is also allowable, since the housing washer raceway is designed flat.
- The bearings can be handled easily, as the shaft washer has the lifting hole in the center (some bearings have lifting nuts in the lifting holes: Design 2, 3, 5), and the housing washer also has lifting tapped hole.
- In many cases, housing washer is fixed to the housing with full dog point set screws. Thus, the outside surface is equipped with a groove to receive the tip of the set screws.

Boundary dimensions	Custom-manufactured to dimensions required for specific equipment.
Tolerances	Consult with JTEKT, as special tolerances are adopted for specific application. Generally equivalent to class 0 specified in JIS (refer to Table 2-8 on page 27).
Misalignment	No misalignment is allowable.
Standard cage	Machined cage
Equivalent load	**Dynamic equivalent load** ····· $P_a = F_a$ **Static equivalent load** ····· $P_{0a} = F_a$

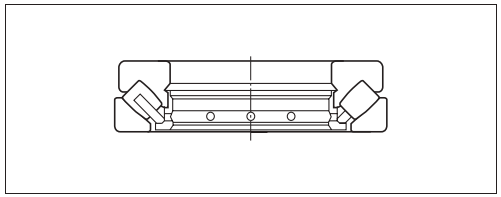
Spherical thrust roller bearings



- Spherical thrust roller bearings are designed to carry high axial loads. They can also support radial load if magnitude is no more than 55 % of the axial load being carried.
- Having a spherical housing washer raceway surface, these bearings are self-alignings.
- These bearings are not suitable for high-speed rotation. In general, they are used with oil lubrication.

Boundary dimensions	As specified in JIS B 1512.
Tolerances	As specified in JIS B 1514, class 0. (refer to Table 2-8 on page 27.)
Allowable aligning angle	0.035 – 0.052 rad (2° – 3°) in general, depending on bearing series.
Amount of preload for spherical thrust roller bearings	Spherical thrust roller bearings sometimes suffer from scuffing, smearing, or other defects due to sliding which occurs between the roller and raceway surface under normal operation. To eliminate such sliding, it is necessary to mount the bearing without clearance, and apply an axial load (preload) larger than the minimum necessary axial load determined by the following equation. (the higher value determined by the two equations should be taken) $F_{a\,min} = \frac{C_{0a}}{2\,000}$ $F_{a\,min} = 1.8F_r + 1.33\left(\frac{n}{1\,000}\right)^2 \cdot \left(\frac{C_{0a}}{1\,000}\right)^2 \times 10^{-4}$ where : $F_{a\,min}$: minimum necessary axial load N F_r : radial load N n : rotational speed min^{-1} C_{0a} : static axial load rating N
Standard cage	Machined cage
Equivalent axial load	**Dynamic equivalent axial load** ····· $P_a = 1.2\,F_r + F_a$ **Static equivalent axial load** ····· $P_{0a} \fallingdotseq 2.7\,F_r + F_a$ (Note : $F_r / F_a \leqq 0.55$)

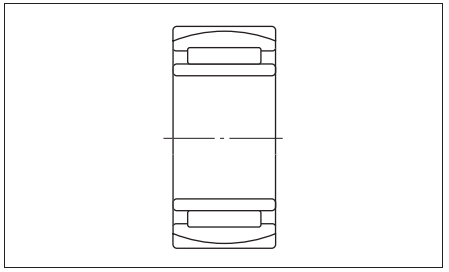
Bearings for continuous casting machines

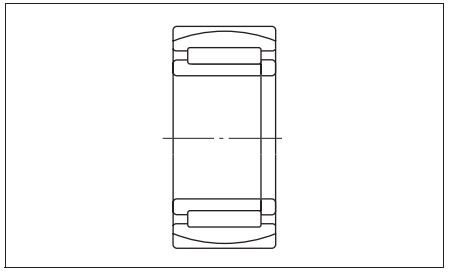
- In continuous casting machines, roll support bearings are used under heavy loads and at extremely low speed.
  In addition, the operating conditions are severe, resulting in exposure to splashing water and scales.
- SCP bearings for fixed side and SC bearings for free side are used for end of rolls.
- HSC bearing units with half-round outer ring is used for the intermediate support section of beetle-shape rolls, such as driving rolls.
- JTEKT bearings for continuous casting machines are designed based on a full complement cylindrical roller bearing, with reference to maximized static load ratings. Crowning are set up on rolling surface of its rollers, according to the size of loads, which contributes to solve stress concentration at specific location.
- The bearing has the self-aligning mechanism to absorb roll bending and misalignment due to heavy load.

■ SC bearings (free side)
(page 430)



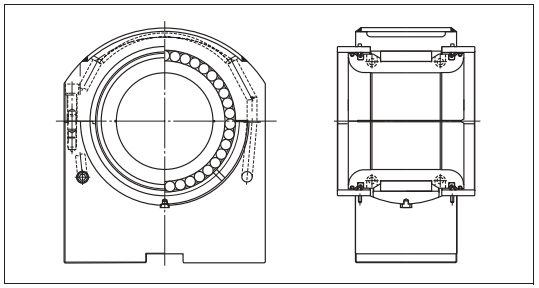
- To accommodate thermal contraction and expansion of roll, the inner ring of this bearing are designed to move smoothly in the axial direction.

■ SCP bearings (fixed side)
(page 430)



- The bearing has been developed for the purpose of improvement in short service life of spherical roller bearings most commonly used for continuous casting machines.
- The ribs provided for the inner and outer rings and loose rib allow accommodation of axial loads generated by thermal contraction and expansion of rolls.

■ HSC bearing units with half-round outer ring (page 436)



- To accommodate thermal contraction and expansion of roll, the inner ring and roller of this bearing are designed to move smoothly in the axial direction.
- This unit has unique structure, with a half-round outer ring placed on the loaded side only.
- This special half-round outer ring and compact seal design realizes a 15 % increase in static load rating over that of conventional products.
- The unique jacket design adjusts the flow of water and enables a high cooling efficiency, equivalent to that of conventional products with a lower water flow rate of 55 %.

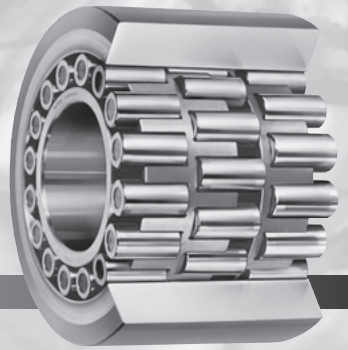
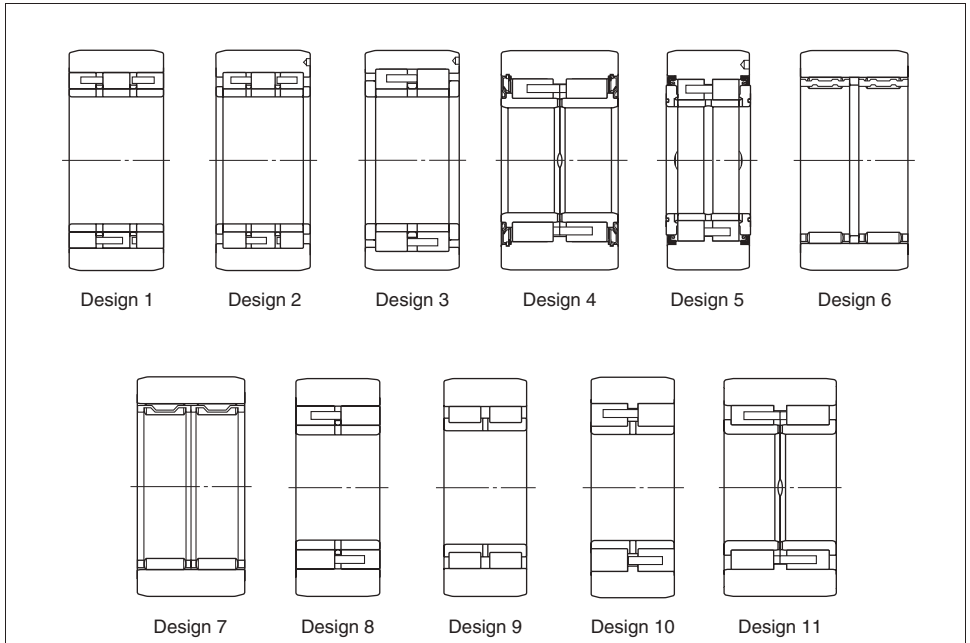
Cylindrical roller bearings for the backing shafts of multi-roll mills





- Since the bearing is used as the back up roll in multi-roll mills, the outer ring is designed thicker than ordinary bearings.
- Since high accuracy is required for these bearings under high pressure, they are designed to have high load rating and accuracy.
- Since several bearings are mounted on a shaft, radial runout of outer ring and variations of bearing section height per unit after assembly are minimized.
- Even if the outside surface of bearing's outer ring gets rough due to foreign matters caught in, the bearing can be used again by grinding.
- Bearings installed on the backing shaft come in cylindrical roller bearing and long cylindrical roller bearing. Either of both type bearings is used appropriately depending on the characteristics of rolling mills. Above all, the cylindrical roller bearing is most commonly used.
- **These bearings are commonly used for the backing shafts of multi-roll mills.**

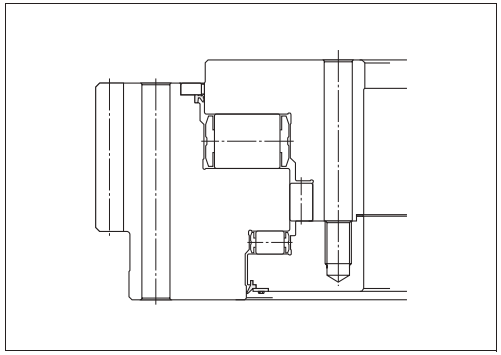
Slewing rim bearings for tunnel-boring machine

Koyo®

• These bearings are designed to support the main cutters of tunnel-boring machines.

■ DTR···T (triple-row combined roller type) (page 450)

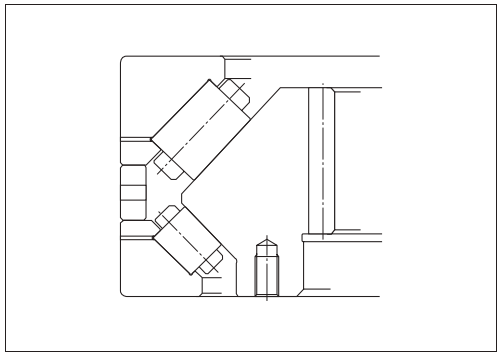


The DTR···T slewing rim bearing is a triple-row combined cylindrical roller bearing. This bearing is provided with various features required to support the main cutters of tunnel-boring machines, including superior impact resistance, high load ratings, and excellent sealing performance. When used with forced oil circulation, this bearing is provided with oil supply and oil drain ports.

As the sealing mechanism of this bearing, a labyrinth, dust seal, or pressure-resistant seal featuring high sealing performance (resistant to a static pressure of 0.3 MPa) can be selected, depending on the lubrication method used.

For convenience of transportation, DTR···T bearings with the bearing rings split cylindrically into two or four parts are also available (SP/DTR···T).

■ 2TR··· (double-row tapered roller type) (page 458)



The 2TR··· slewing rim bearing is a double-row tapered roller bearing. To ensure high axial load ratings, this bearing features a large contact angle. Large-sized rollers are provided on the axial load-accommodating side.

The bearing ring on the non-gear side is made from bearing steel. It is treated through normal hardening, so therefore does not have any "soft zone," which an induction-hardened bearing may have, thus eliminating limits in determining the location of the non-gear-side bearing ring on machines or equipment.

The 2TR··· bearing was developed to support the main cutters (oil bath lubrication) of tunnel-boring machines.

DTR···T type (With internal gear)

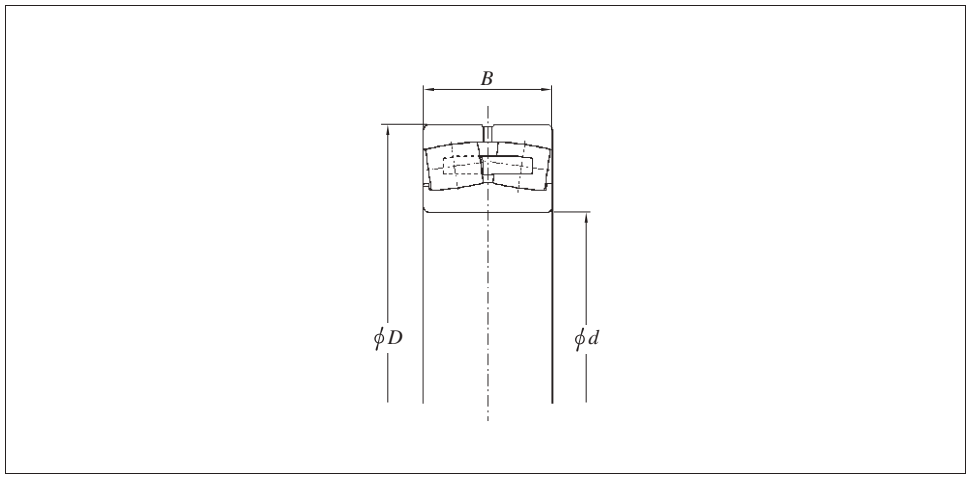
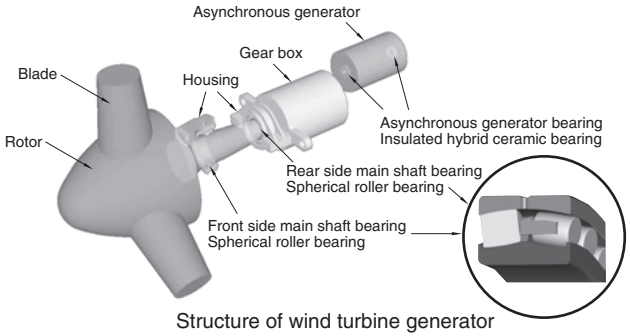
Spherical roller bearing for wind turbine generator main shaft





Structure of wind turbine generator

Features of spherical roller bearing for wind turbine generator main shaft

- The bearing, featuring superior radial load rating, can accommodate radial load and axial load in both directions.
- Optimization of raceway profile allows stable rotation performance.
- It absorbs misaligement in mounting and deflection. (Allowable aligning angle : 1° or more)

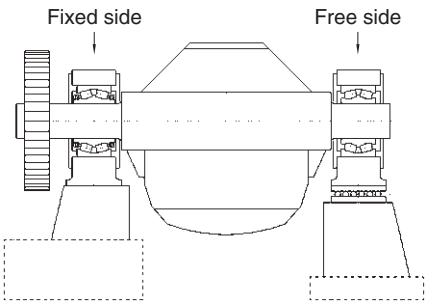
400	400	85	**THP400X400**	14 900	200

Trunnion split bearing for converter



In integral type bearings, if they are required to be replaced at fixed side, all the tilting units surrounding the bearings must be removed, and exceedingly major replacement work has been required.
Use of split bearing enables easy handling of bearings and easy maintenance in the future.

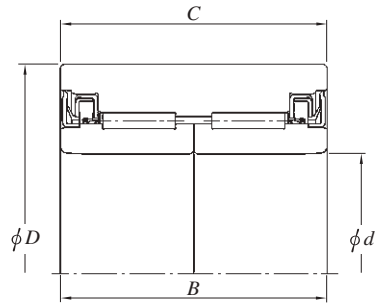
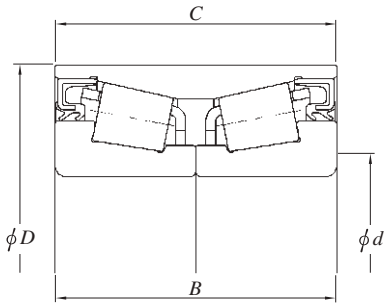
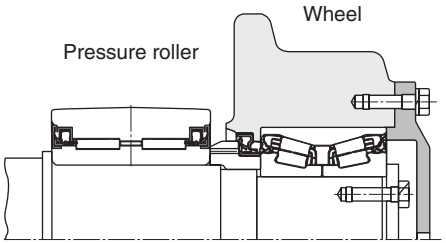
Sealed bearing for sintered equipment

· Bearing for pressure roller
Sealed type double-row cylindrical roller bearing



· Wheel bearing
Sealed type double-row tapered roller bearing





Bearing for pressure roller

- Special seals are provided on both sides to prevent ingress of sintered dusts.
- Special heat resistant grease withstanding high temperature and long use is adopted.
- High load rating full complement type.
- Thickness is optimized to secure strength of outer ring.
- Internal clearance of bearing is optimized.

Wheel bearing

- The seal mechanism prevents ingress of foreign matters into bearings.
- Special heat resistant grease withstanding high temperature and long use is adopted.
- Crowning is optimized to accommodate heavy load.
- Internal clearance of bearing is optimized.
- Bearing with the inner ring having locating snap ring to improve retrofitting performance is also available.

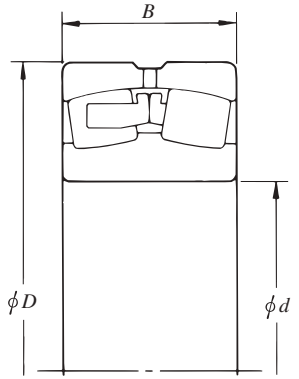
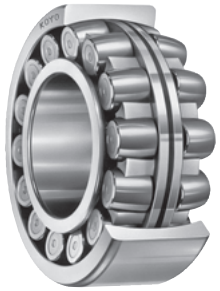
Spherical roller bearings for shaker screens



22326ROVSW502
C_r = 948 kN
C_{0r} = 1 200 kN



Features of the bearings for shaker screens

(1) Considering lubricant flow under vibration and lubricating status of sliding surface, outer ring guided cage in special profile is used.
(2) The cage is made of high-tensile brass casting for sufficient strength and resistance to wear.
(3) While the bearing is rotated, peripheral speed difference occurs to the double row rollers. To prevent damages to cage including wear and breakage, separate and non-incorporated, prong type machined cage is used.
(4) For smooth rolling motion of rollers, asymmetrical rollers having cone center are adopted.
(5) Especially, bearing outside diameter tolerance is held to a small allowable variation.
(6) C3 or C4 bearing internal clearance is used.

Bearing No.	Boundary dimensions (mm)

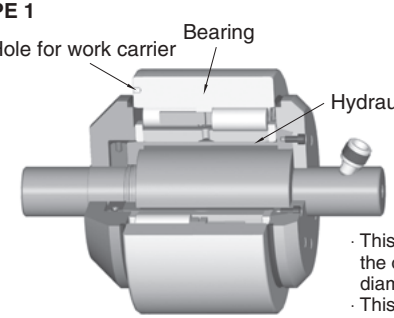
• Bearing number of spherical roller bearings (mainly 223 series) should be followed by "R (RR) OVS W502".

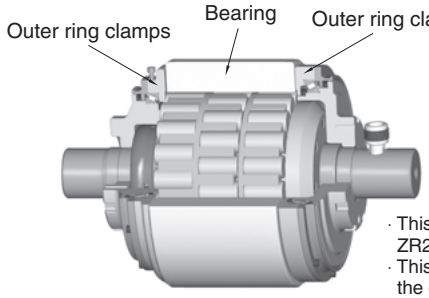
Regrinding jigs for bearings for backing shafts

TYPE 1



· This type is suitable to bearings with the outer ring with ribs and with a bore diameter no less than 70 mm.
· This jig requires holes for work carrier on the end face of the outer ring.

TYPE 2

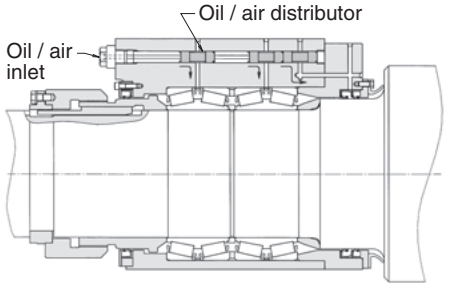


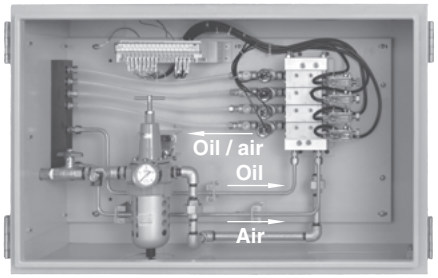
· This jig is suitable with bearings for ZR21 and ZR22 types.
· This jig is suitable with bearings with the outer ring without ribs.

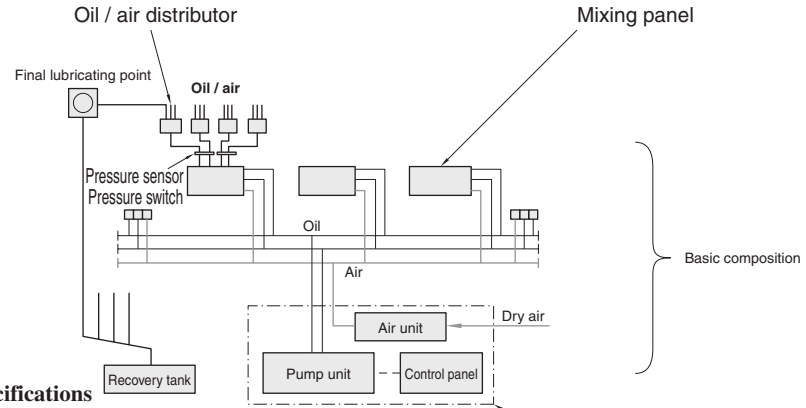
- The regrinding jig grinds the outside surfaces of bearings used on the backing shafts of multi-roll mills with high precision.
- The jig hydraulically grinds the outside surface while turning the outer ring and retaining the inner ring stationary, while it completely nullifies any clearance on the fitting surface between the jig and bearing and the internal clearance of the bearing, minimizing radial runout.
- The jig grinds bearing assemblies without need of disassembly, causing improvement in workability of installation and removal.

Oil / air lubricator for steel making and rolling equipment

High sealing performance ····· Elimination of ingress of foreign matters by pressure in chock (housing)
High reliability of lubrication ····· Superior lubricating performance by using oil of high viscosity and synthetic oil
Clean working environment ····· Clean environment by recovering oil







Main specifications

Lubricated object	Rolling mill roll neck bearing Rolling mill auxiliary roll bearing Continuous casting machine guide roll bearing Feed roll bearing, etc.
Tank capacity	From 250 to 2 000 ℓ
Number of lubricating points	1 000 points or more are available
Alarm unit	Respective sections in main unit End of oil and air piping
Lubricated oil q'ty	$Q = 0.085 \cdot d \cdot R/A$ Q : Lubricated oil q'ty cm^3/hour d : Bearing bore diameter mm R : Bearing row number A : Speed coefficient (normally $A = 5$)

Celsius temperature	℃ [Celsius(s)] {t ℃ = (t + 273.15) K}	℉ [degree(s) Fahrenheit]	t ℉ = $\frac{5}{9}$ (t − 32) ℃	t ℃ = ($\frac{9}{5}$t + 32) ℉
Linear expansion coefficient	K^{-1}	$℃^{-1}$ [per degree]		
Heat	J [joule(s)] {1 J=1 N·m}	erg [erg(s)] kgf·m cal_{IT} [I. T. calories]	1 erg = 10^{-7} J 1 cal_{IT} = 4.186 8 J 1 $Mcal_{IT}$ = 1.163 kW·h	1 J = 10^{7} erg 1 J = 0.238 85 cal_{IT} 1 kW·h = 0.86 × 10^{6} cal_{IT}
Thermal conductivity	W / (m·K)	W / (m·℃) cal / (s·m·℃)	1 W / (m·℃) = 1 W / (m·K) 1 cal / (s·m·℃) = 4.186 05 W / (m·K)	
Coefficient of heat transfer	W / (m^2·K)	W / (m^2·℃) cal / (s·m^2·℃)	1 W / (m^2·℃) = 1 W / (m^2·K) 1 cal / (s·m^2·℃) = 4.186 05 W / (m^2·K)	
Heat capacity	J / K	J / ℃	1 J / ℃ = 1 J / K	
Massic heat capacity	J / (kg·K)	J / (kg·℃)		

[Note] ＊ : Unit can be used as an SI unit.
No asterisk : Unit cannot be used.
